# Chapter 2

Evolution of the Major Programming Languages

# Programming Languages

SEVENTH EDITION

Robert W. Sebesta

# Chapter 2 Topics

- Zuse's Plankalkul
- Minimal Hardware Programming: Pseudocodes
- The IBM 704 and Fortran
- Functional Programming: LISP
- The First Step Toward Sophistication: ALGOL 60
- Computerizing Business Records: COBOL
- The Beginnings of Timesharing: BASIC

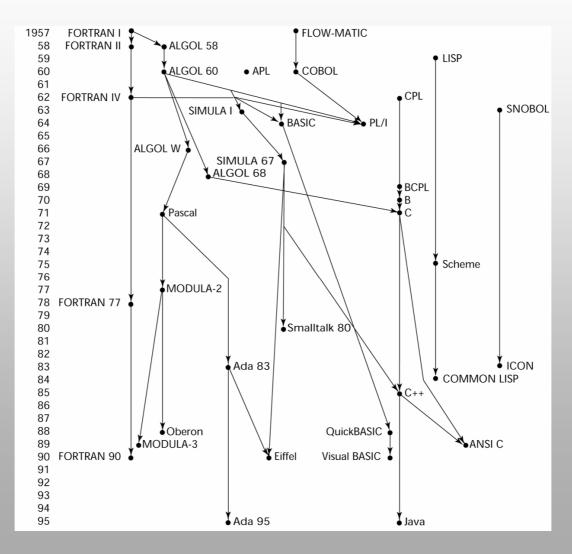

# Chapter 2 Topics (continued)

- Everything for Everybody: PL/I
- Two Early Dynamic Languages: APL and SNOBOL
- The Beginnings of Data Abstraction: SIMULA 67
- Orthogonal Design: ALGOL 68
- Some Early Descendants of the ALGOLs
- Programming Based on Logic: Prolog
- History's Largest Design Effort: Ada

# Chapter 2 Topics (continued)

- Object-Oriented Programming: Smalltalk
- Combining Imperative ad Object-Oriented Features: C++
- An Imperative-Based Object-Oriented Language: Java
- Scripting Languages: JavaScript, PHP, and Python
- A C-Based Language for the New Millennium: C#
- Markup/Programming Hybrid Languages

# Genealogy of Common Languages

### Zuse's Plankalkül

- Never implemented
- Advanced data structures
  - floating point, arrays, records
- Invariants

# Plankalkül Syntax

 An assignment statement to assign the expression A[4] + 1 to A[5]

# Minimal Hardware Programming: Pseudocodes

- What was wrong with using machine code?
  - Poor readability
  - Poor modifiability
  - Expression coding was tedious
  - Machine deficiencies—no indexing or floating point

#### Pseudocodes: Short Code

- Short Code developed by Mauchly in 1949 for BINAC computers
  - Expressions were coded, left to right
  - Example of operations:

# Pseudocodes: Speedcoding

- Speedcoding developed by Backus in 1954 for IBM 701
- Pseudo ops for arithmetic and math functions
  - Conditional and unconditional branching
  - Auto-increment registers for array access
  - Slow!
  - Only 700 words left for user program

# Pseudocodes: Related Systems

- The UNIVAC Compiling System
  - Developed by a team led by Grace Hopper
  - Pseudocode expanded into machine code
- David J. Wheeler (Cambridge University)
  - developed a method of using blocks of relocatable addresses to solve the problem of absolute addressing

#### IBM 704 and Fortran

- Fortran 0: 1954 not implemented
- Fortran I:1957
  - Designed for the new IBM 704, which had index registers and floating point hardware
  - Environment of development
    - Computers were small and unreliable
    - Applications were scientific
    - No programming methodology or tools
    - Machine efficiency was most important

## Design Process of Fortran

- Impact of environment on design of Fortran I
  - No need for dynamic storage
  - Need good array handling and counting loops
  - No string handling, decimal arithmetic, or powerful input/output (commercial stuff)

#### Fortran I Overview

- First implemented version of Fortran
  - Names could have up to six characters
  - Post-test counting loop (DO)
  - Formatted I/O
  - User-defined subprograms
  - Three-way selection statement (arithmetic IF)
  - No data typing statements

## Fortran I Overview (continued)

- First implemented version of FORTRAN
  - No separate compilation
  - Compiler released in April 1957, after 18 worker-years of effort
  - Programs larger than 400 lines rarely compiled correctly, mainly due to poor reliability of 704
  - Code was very fast
  - Quickly became widely used

#### Fortran II

- Distributed in 1958
  - Independent compilation
  - Fixed the bugs

#### Fortran IV

- Evolved during 1960–62
  - Explicit type declarations
  - Logical selection statement
  - Subprogram names could be parameters
  - ANSI standard in 1966

#### Fortran 77

- Became the new standard in 1978
  - Character string handling
  - Logical loop control statement
  - IF-THEN-ELSE statement

#### Fortran 90

- Most significant changes from Fortran 77
  - Modules
  - Dynamic arrays
  - Pointers
  - Recursion
  - CASE statement
  - Parameter type checking

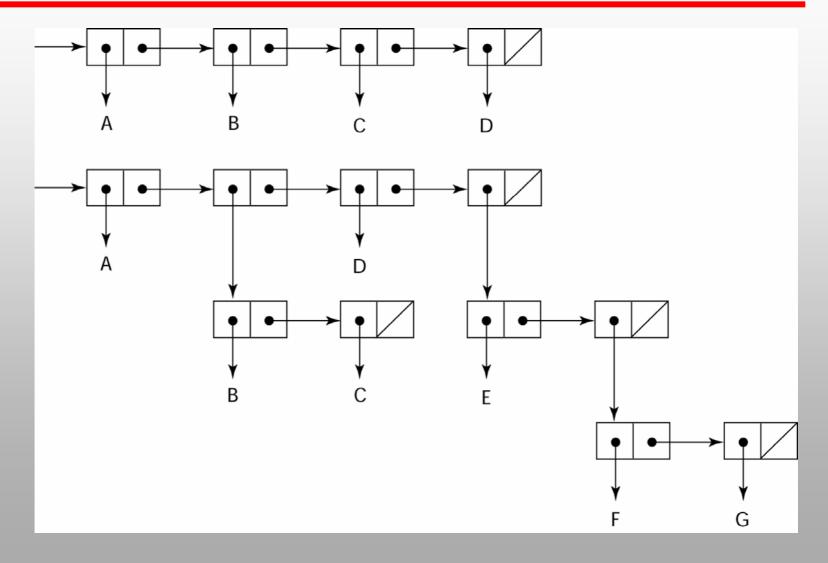

#### Fortran Evaluation

- Highly optimizing compilers (all versions before 90)
  - Types and storage of all variables are fixed before run time
- Dramatically changed forever the way computers are used
- Characterized as the *lingua franca* of the computing world

# Functional Programming: LISP

- LISt Processing language
  - Designed at MIT by McCarthy
- Al research needed a language to
  - Process data in lists (rather than arrays)
  - Symbolic computation (rather than numeric)
- Only two data types: atoms and lists
- Syntax is based on lambda calculus

# Representation of Two LISP Lists

### LISP Evaluation

- Pioneered functional programming
  - No need for variables or assignment
  - Control via recursion and conditional expressions
- Still the dominant language for Al
- COMMON LISP and Scheme are contemporary dialects of LISP
- ML, Miranda, and Haskell are related languages

#### Scheme

- Developed at MIT in mid 1970s
- Small
- Extensive use of static scoping
- Functions as first-class entities
- Simple syntax (and small size) make it ideal for educational applications

#### **COMMON LISP**

- An effort to combine features of several dialects of LISP into a single language
- Large, complex

# The First Step Toward Sophistication: ALGOL 60

- Environment of development
  - FORTRAN had (barely) arrived for IBM 70x
  - Many other languages were being developed, all for specific machines
  - No portable language; all were machinedependent
  - No universal language for communicating algorithms
- ALGOL 60 was the result of efforts to design a universal language

# Early Design Process

- ACM and GAMM met for four days for design (May 27 to June 1, 1958)
- Goals of the language
  - Close to mathematical notation
  - Good for describing algorithms
  - Must be translatable to machine code

#### ALGOL 58

- Concept of type was formalized
- · Names could be any length
- Arrays could have any number of subscripts
- Parameters were separated by mode (in & out)
- Subscripts were placed in brackets
- Compound statements (begin ... end)
- Semicolon as a statement separator
- Assignment operator was :=
- · if had an else-if clause
- No I/O "would make it machine dependent"

# **ALGOL 58 Implementation**

- Not meant to be implemented, but variations of it were (MAD, JOVIAL)
- Although IBM was initially enthusiastic, all support was dropped by mid 1959

#### **ALGOL 60 Overview**

- Modified ALGOL 58 at 6-day meeting in Paris
- New features
  - Block structure (local scope)
  - Two parameter passing methods
  - Subprogram recursion
  - Stack-dynamic arrays
  - Still no I/O and no string handling

#### **ALGOL 60 Evaluation**

#### Successes

- It was the standard way to publish algorithms for over 20 years
- All subsequent imperative languages are based on it
- First machine-independent language
- First language whose syntax was formally defined (BNF)

## ALGOL 60 Evaluation (continued)

#### Failure

- Never widely used, especially in U.S.
- Reasons
  - Lack of I/O and the character set made programs non-portable
  - Too flexible—hard to implement
  - Entrenchment of Fortran
  - Formal syntax description
  - Lack of support from IBM

### Computerizing Business Records: COBOL

- Environment of development
  - UNIVAC was beginning to use FLOW-MATIC
  - USAF was beginning to use AIMACO
  - IBM was developing COMTRAN

# COBOL Historical Background

- Based on FLOW-MATIC
- FLOW-MATIC features
  - Names up to 12 characters, with embedded hyphens
  - English names for arithmetic operators (no arithmetic expressions)
  - Data and code were completely separate
  - Verbs were first word in every statement

## **COBOL Design Process**

- First Design Meeting (Pentagon) May 1959
- Design goals
  - Must look like simple English
  - Must be easy to use, even if that means it will be less powerful
  - Must broaden the base of computer users
  - Must not be biased by current compiler problems
- Design committee members were all from computer manufacturers and DoD branches
- Design Problems: arithmetic expressions? subscripts? Fights among manufacturers

#### **COBOL Evaluation**

#### Contributions

- First macro facility in a high-level language
- Hierarchical data structures (records)
- Nested selection statements
- Long names (up to 30 characters), with hyphens
- Separate data division

### COBOL: DoD Influence

- First language required by DoD
  - would have failed without DoD
- Still the most widely used business applications language

## The Beginning of Timesharing: BASIC

- Designed by Kemeny & Kurtz at Dartmouth
- Design Goals:
  - Easy to learn and use for non-science students
  - Must be "pleasant and friendly"
  - Fast turnaround for homework
  - Free and private access
  - User time is more important than computer time
- Current popular dialect: Visual BASIC
- First widely used language with time sharing

# 2.8 Everything for Everybody: PL/I

- Designed by IBM and SHARE
- Computing situation in 1964 (IBM's point of view)
  - Scientific computing
    - IBM 1620 and 7090 computers
    - FORTRAN
    - SHARE user group
  - Business computing
    - IBM 1401, 7080 computers
    - COBOL
    - GUIDE user group

# PL/I: Background

#### • By 1963

- Scientific users began to need more elaborate
  I/O, like COBOL had; business users began to need floating point and arrays
- It looked like many shops would begin to need two kinds of computers, languages, and support staff—too costly

#### The obvious solution

- Build a new computer to do both kinds of applications
- Design a new language to do both kinds of applications

## PL/I: Design Process

- Designed in five months by the 3 X 3 Committee
  - Three members from IBM, three members from SHARE
- Initial concept
  - An extension of Fortran IV
- Initially called NPL (New Programming Language)
- Name changed to PL/I in 1965

## PL/I: Evaluation

- PL/I contributions
  - First unit-level concurrency
  - First exception handling
  - Switch-selectable recursion
  - First pointer data type
  - First array cross sections
- Concerns
  - Many new features were poorly designed
  - Too large and too complex

# Two Early Dynamic Languages: APL and SNOBOL

- Characterized by dynamic typing and dynamic storage allocation
- Variables are untyped
  - A variable acquires a type when it is assigned a value
- Storage is allocated to a variable when it is assigned a value

# APL: A Programming Language

- Designed as a hardware description language at IBM by Ken Iverson around 1960
  - Highly expressive (many operators, for both scalars and arrays of various dimensions)
  - Programs are very difficult to read
- Still in use; minimal changes

### **SNOBOL**

- Designed as a string manipulation language at Bell Labs by Farber, Griswold, and Polensky
- Powerful operators for string pattern matching
- Slower than alternative languages (and thus no longer used for writing editors)
- Stilled used for certain text processing tasks

# The Beginning of Data Abstraction: SIMULA 67

- Designed primarily for system simulation in Norway by Nygaard and Dahl
- Based on ALGOL 60 and SIMULA I
- Primary Contributions
  - Co-routines a kind of subprogram
  - Implemented in a structure called a class
  - Classes are the basis for data abstraction
  - Classes are structures that include both local data and functionality

# Orthogonal Design: ALGOL 68

- From the continued development of ALGOL
  60 but not a superset of that language
- Source of several new ideas (even though the language itself never achieved widespread use)
- Design is based on the concept of orthogonality
  - A few principle concepts, few combining mechanisms

### **ALGOL 68 Evaluation**

#### Contributions

- User-defined data structures
- Reference types
- Dynamic arrays (called flex arrays)

#### Comments

- Less usage than ALGOL 60
- Had strong influence on subsequent languages, especially Pascal, C, and Ada

# Early Descendants of ALGOLs

- ALGOL languages impacted all imperative languages
  - Pascal
  - C
  - Modula/Modula 2
  - Ada
  - Oberon
  - C++/Java
  - Perl (to some extent)

### Pascal - 1971

- Developed by Wirth (a member of the ALGOL 68 committee)
- Designed for teaching structured programming
- Small, simple, nothing really new
- Largest impact on teaching programming
  - From mid-1970s until the late 1990s, it was the most widely used language for teaching programming

#### C - 1972

- Designed for systems programming (at Bell Labs by Dennis Richie)
- Evolved primarily from BCLP, B, but also ALGOL 68
- Powerful set of operators, but poor type checking
- Initially spread through UNIX
- Many areas of application

### Perl

- Related to ALGOL only through C
- A scripting language
  - A script (file) contains instructions to be executed
  - Other examples: sh, awk, tcl/tk
- Developed by Larry Wall
- Perl variables are statically typed and implicitly declared
  - Three distinctive namespaces, denoted by the first character of a variable's name
- Powerful but somewhat dangerous
- Widely used as a general purpose language

## Programming Based on Logic: Prolog

- Developed, by Comerauer and Roussel (University of Aix-Marseille), with help from Kowalski (University of Edinburgh)
- Based on formal logic
- Non-procedural
- Can be summarized as being an intelligent database system that uses an inferencing process to infer the truth of given queries
- Highly inefficient, small application areas

# History's Largest Design Effort: Ada

- Huge design effort, involving hundreds of people, much money, and about eight years
  - Strawman requirements (April 1975)
  - Woodman requirements (August 1975)
  - Tinman requirements (1976)
  - Ironman equipments (1977)
  - Steelman requirements (1978)
- Named Ada after Augusta Ada Byron, known as being the first programmer

#### Ada Evaluation

#### Contributions

- Packages support for data abstraction
- Exception handling elaborate
- Generic program units
- Concurrency through the tasking model

#### Comments

- Competitive design
- Included all that was then known about software engineering and language design
- First compilers were very difficult; the first really usable compiler came nearly five years after the language design was completed

#### Ada 95

- Ada 95 (began in 1988)
  - Support for OOP through type derivation
  - Better control mechanisms for shared data
  - New concurrency features
  - More flexible libraries
- Popularity suffered because the DoD no longer requires its use but also because of popularity of C++

## Object-Oriented Programming: Smalltalk

- Developed at Xerox PARC, initially by Alan Kay, later by Adele Goldberg
- First full implementation of an objectoriented language (data abstraction, inheritance, and dynamic type binding)
- Pioneered the graphical user interface design
- Promoted OOP

## Combining Imperative and Object-Oriented Programming: C++

- Developed at Bell Labs by Stroustrup in 1980
- Evolved from C and SIMULA 67
- Facilities for object-oriented programming, taken partially from SIMULA 67
- Provides exception handling
- A large and complex language, in part because it supports both procedural and OO programming
- Rapidly grew in popularity, along with OOP
- ANSI standard approved in November 1997
- Microsoft's version (released with .NET in 2002): Managed C++

- delegates, interfaces, no multiple inheritance

# Related OOP Languages

- Eiffel (designed by Bertrand Meyer 1992)
  - Not directly derived from any other language
  - Smaller and simpler than C++, but still has most of the power
  - Lacked popularity of C++ because many C++ enthusiasts were already C programmers
- Delphi (Borland)
  - Pascal plus features to support OOP
  - More elegant and safer than C++

# An Imperative-Based Object-Oriented Language: Java

- Developed at Sun in the early 1990s
  - C and C++ were not satisfactory for embedded electronic devices
- Based on C++
  - Significantly simplified (does not include struct, union, enum, pointer arithmetic, and half of the assignment coercions of C++)
  - Supports only OOP
  - Has references, but not pointers
  - Includes support for applets and a form of concurrency

## Java Evaluation

- Eliminated unsafe features of C++
- Concurrency features
- · Libraries for applets, GUIs, database access
- Portable: Java Virtual Machine concept, JIT compilers
- Widely used for WWW pages
- Use for other areas increased faster than any other language
- Most recent version, 5.0, released in 2004

# Scripting Languages for the Web

#### JavaScript

- A joint venture of Netscape and Sun Microsystems
- Used in Web programming (client side) to create dynamic HTML documents
- Related to Java only through similar syntax

#### PHP

- PHP: Hypertext Preprocessor
- Used for Web applications (server side); produces HTML code as output

#### Python

- An OO interpreted scripting language
- Type checked but dynamically typed
- Supports CGI and form processing

# A C-Based Language for the New Millennium: C#

- Part of the .NET development platform
- Based on C++, Java, and Delphi
- Provides a language for component-based software development
- All .NET languages (C#, Visual BASIC.NET, Managed C++, J#.NET, and Jscript.NET) use Common Type System (CTS), which provides a common class library

Likely to become widely used

# Markup/Programming Hybrid Languages

#### XSLT

- eXtensible Markup Language (XML): a metamarkup language
- eXtensible Stylesheet Language Transformation (XSTL) transforms XML documents for display
- Programming constructs (e.g., looping)

#### JSP

- Java Server Pages: a collection of technologies to support dynamic Web documents
- servlet: a Java program that resides on a Web server;
  servlet's output is displayed by the browser

# Summary

- Development, development environment, and evaluation of a number of important programming languages
- Perspective into current issues in language design
