# Introduction to Bluetooth

---

# Naming

---

## Why its name is Bluetooth?

- ❑ In 10<sup>th</sup> Century, there was a Danish King:

**Harald Blatand**

- ❑ He has united all the Scandinavian Countries
-

# Naming

---

- ❑ Founders used the King's name for the globalization of their technology
- ❑ Bluetooth logo, created by a Scandinavian company, is composed from the characters **"H"** and **"B"** which are Danish king's name initials.

# History

---

- **1994:** *Ericsson started the idea*
  - **1998:** *Special Interest Group (SIG) is formed with 5 companies*
  - **Founder Group:** *Ericsson, Nokia, Intel, Toshiba, IBM*
  - **1999:** *Another 5 Major Companies joined.*
  - **Promoter Group:** *Lucent, 3 Com, Motorola, Microsoft*
  - **2002:** *SIG became an Independent group with more than 3000 companies. Office: Kansas, USA*
-

# History

---

- ❑ SIG released first Spec in 1999 ([Spec 1.0](#))
  - ❑ Latest Spec in 2005 ([Spec 2.0](#))
  - ❑ First retail product found in market: 2001
-

# What is Bluetooth?

---

- ❑ It is a wireless, short range communication technology.
  - ❑ Designed as a low cost, low power technology for all types of mobile devices.
  - ❑ Used as a **cable replacement** among devices located within same area.
  - ❑ Supports high data rate, voice and video transmission.
-

# Applications and Usages

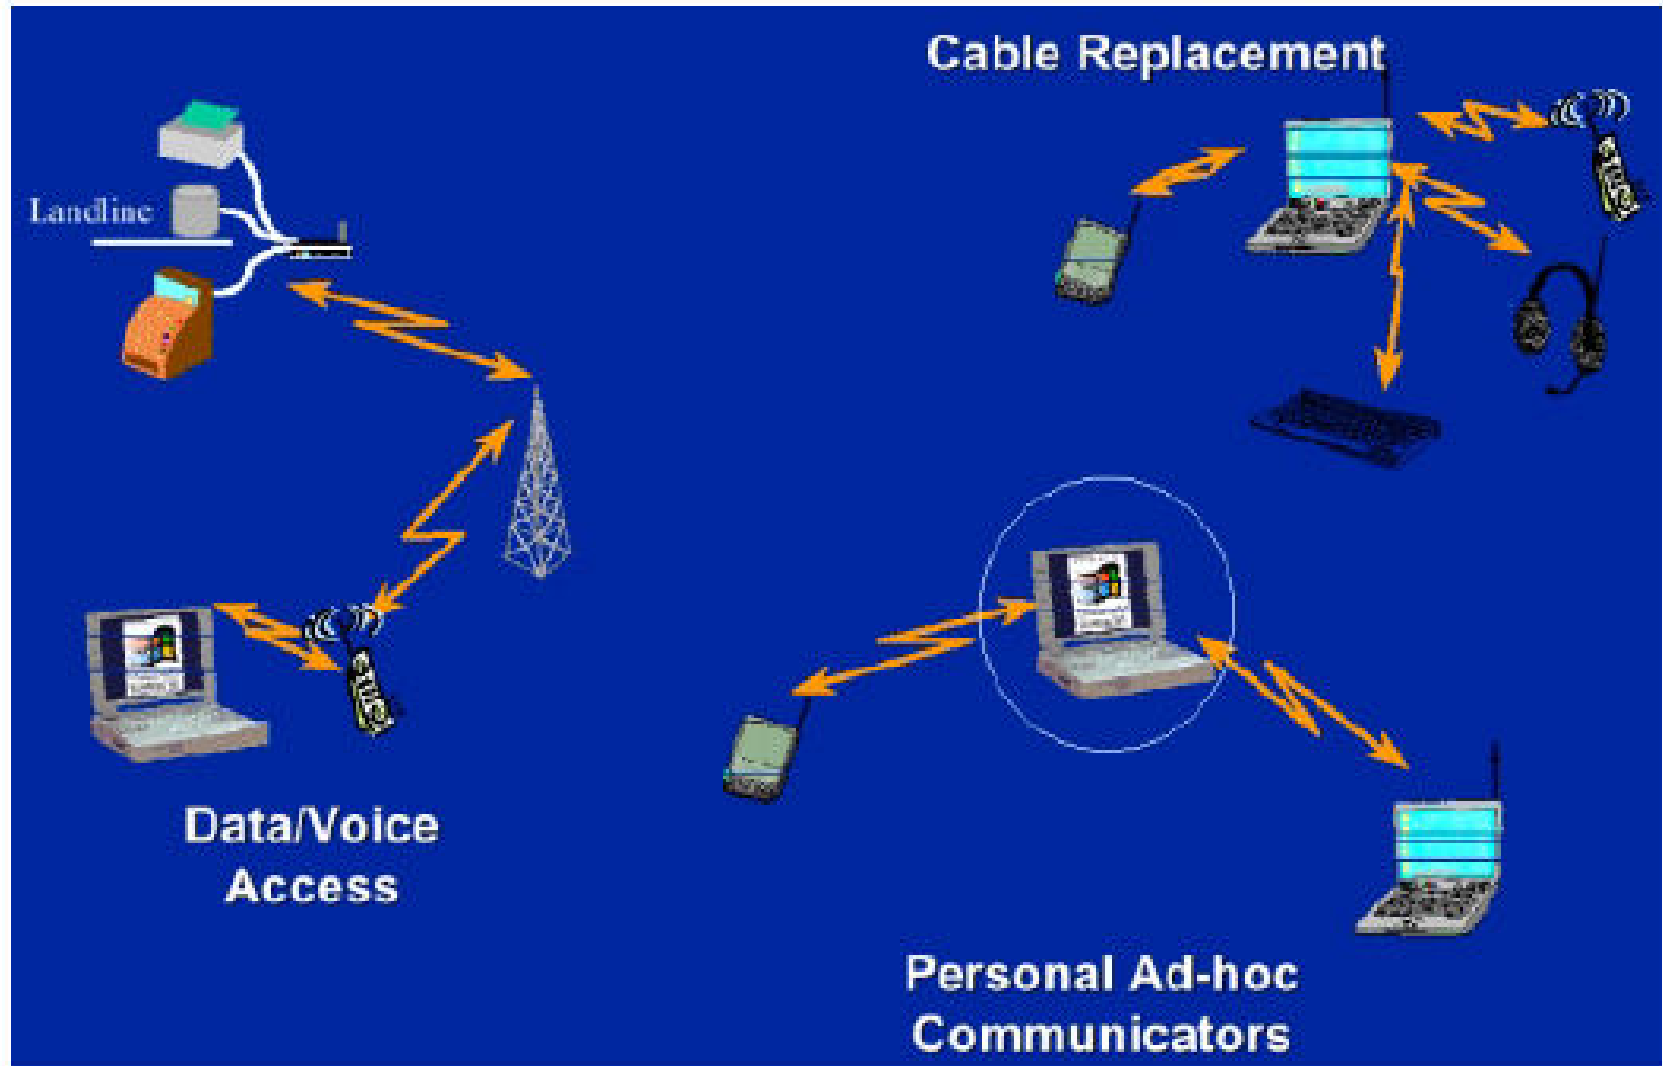

---

- A cable replacement technology
- Range 10+ meters

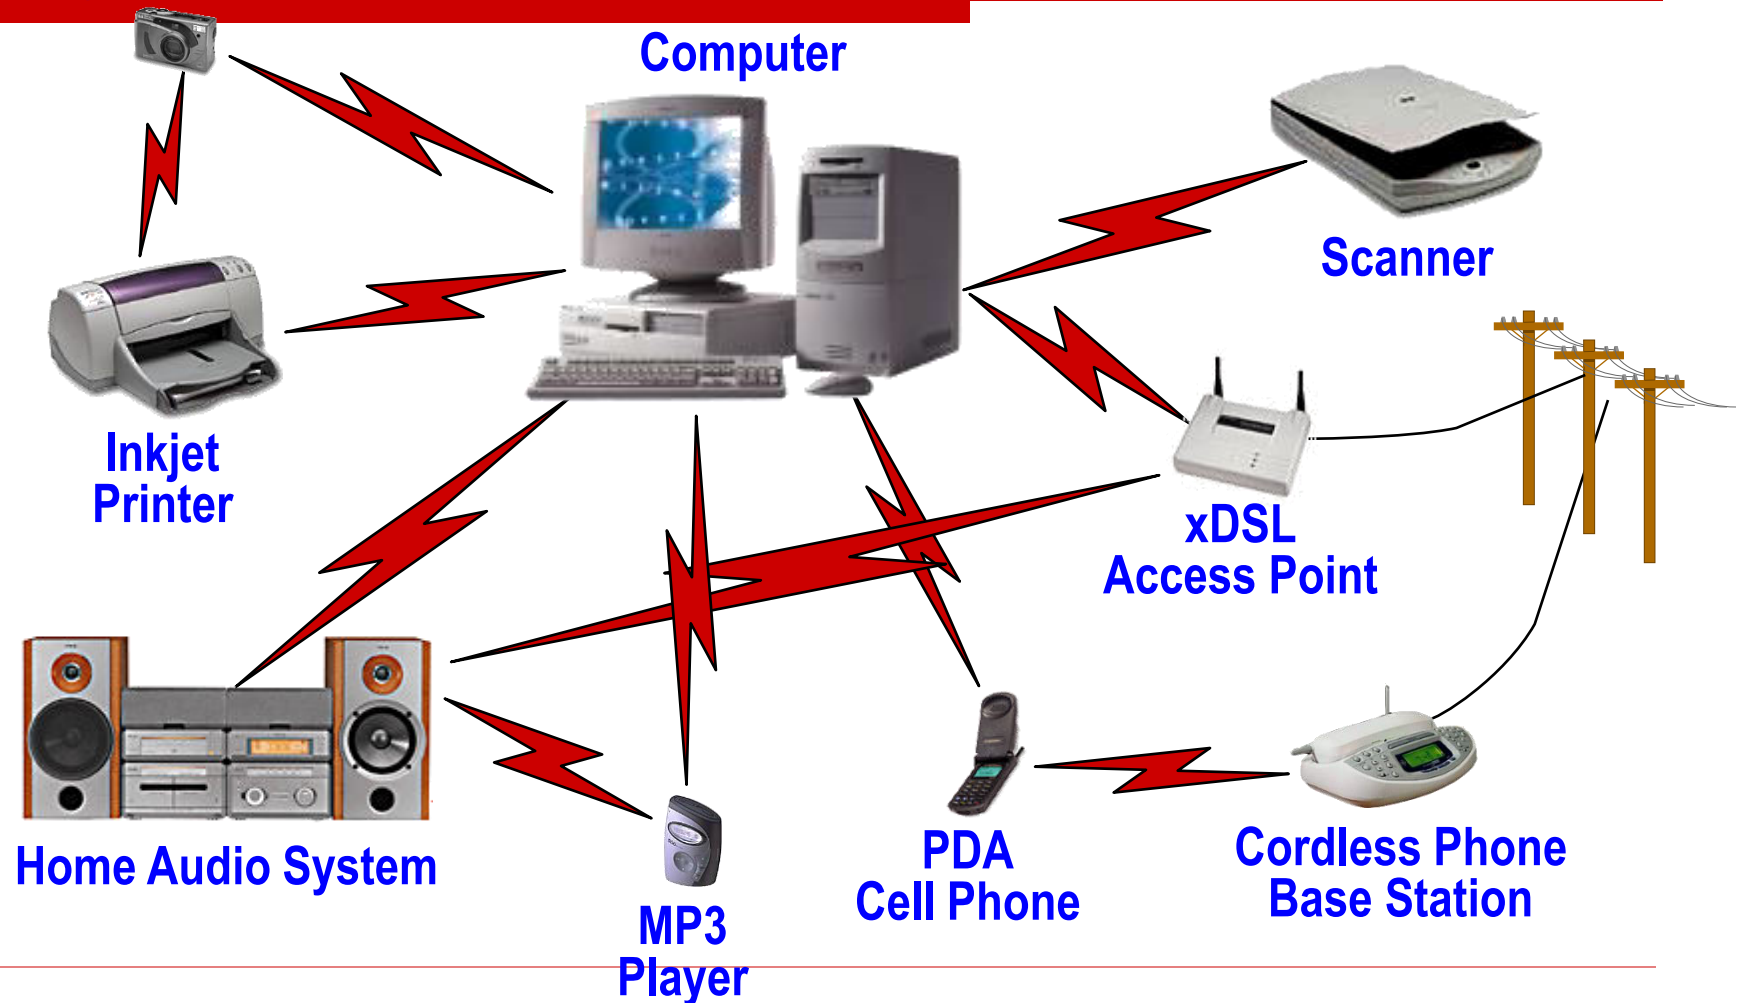

# Bluetooth Concept

# Home Network

## Digital Camera

# Car & Hotel Network

---

## Car Audio System

# LAN Access Point

---

# Ad-Hoc Network

# Usage Models (1)

---

- Internet Bridge
  - ◆ Mobile browsing in the sofa, on the go, in the office, in the car

## Usage Models (2)

- Instant Postcard
  - ◆ Send instant postcards and videoclips

## Usage Models (3)

---

- Ultimate Headset
  - ◆ Keep your hands free

## Usage Models (4)

- Briefcase Trick

- ◆ Laptop in briefcase

E-mail alert through phone,  
browse E-mails in phone

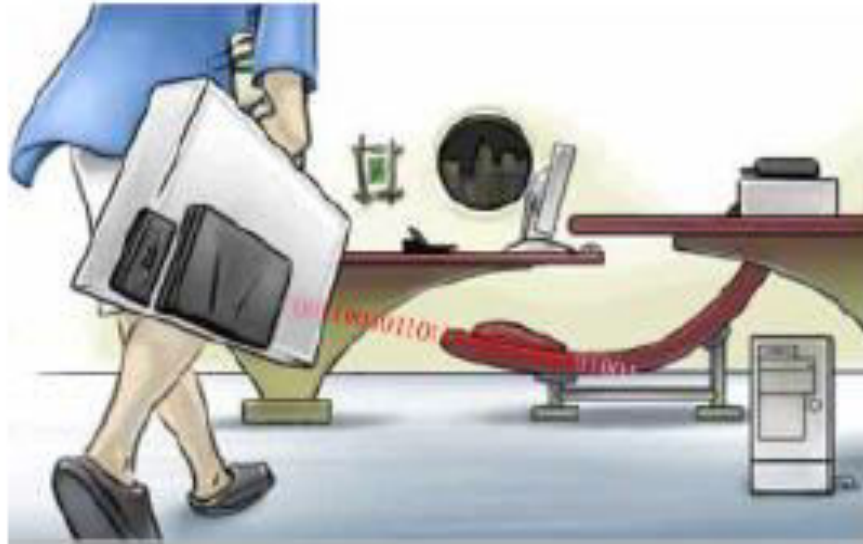

- ◆ Phone off

Answer mail on laptop and  
send mail from phone or  
laptop at arrival

# Usage Models (5)

- Synchronizer
  - ◆ Background synchronization
    - PDA's
    - Cellular phones
    - Notebooks

## Usage Models (6)

- Wireless Workspace
  - ◆ Wirelessly connected computer peripherals

# Usage Models (7)

- Conference Table
  - ◆ Share and exchange data in the meeting room

# Usage Models (8)

- Three in One Phone
  - ◆ One phone three functions
    - Intercom
    - Cordless
    - Cellular

# Bluetooth Products

---

- Blue-Dongle
  - Blue-Connect
  - BluePort
  - Bluetooth printer
  - Bluetooth Modem
-

# Current Products

---

## Access point (AP)

Line connects  
to Internet

Mobile  
Device

# Current Products

---

Blue-Dongle

藍芽連接卡<Blue-Connect>

# Current Products

---

藍芽上網家

<BluePort>

電話線、乙太網路  
寬頻網路、ADSL

# Bluetooth Network

---

- ❑ Two parts: **Piconet** & **Scatternet**
  - ❑ Piconet: **1 Master** can connect to **7 active slaves** simultaneously.
  - ❑ 7 active slaves
  - ❑ 256 parked slaves [power saving mode].
  - ❑ Master controls the slaves in the piconet.
-

# Master-Slave

---

## **Who is a Master in Bluetooth?**

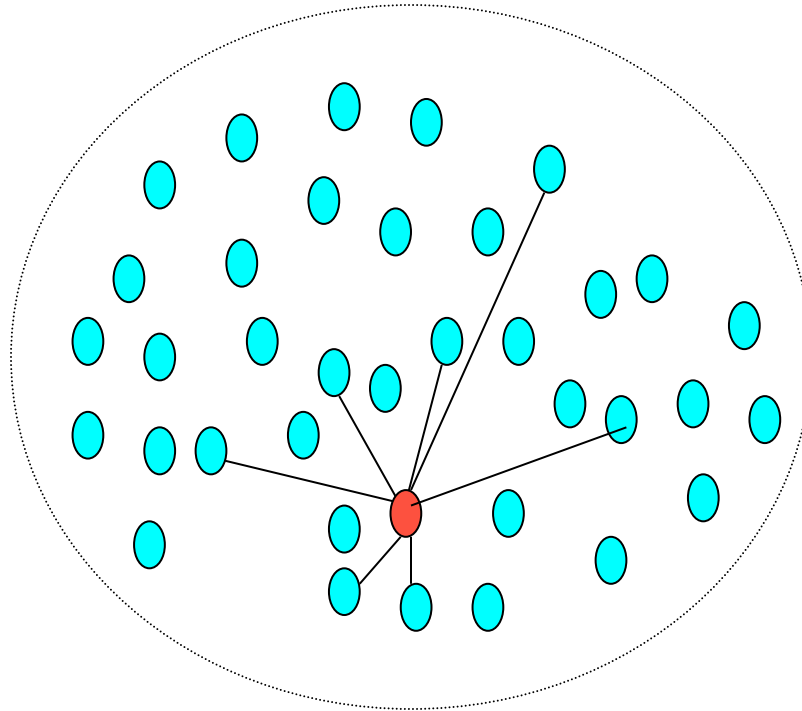

- Any node who starts the Connection Procedure is the Master**
- Master goes to Inquiry State**

## **Who is a Slave in Bluetooth?**

- Any node who responds to the Master is a Slave**
  - Slave goes to Inquiry Scan State**
-

# A Piconet

---

Up to **256 slaves**/piconet

Max **7 slaves** with active state/piconet

---

# Communication in a piconet

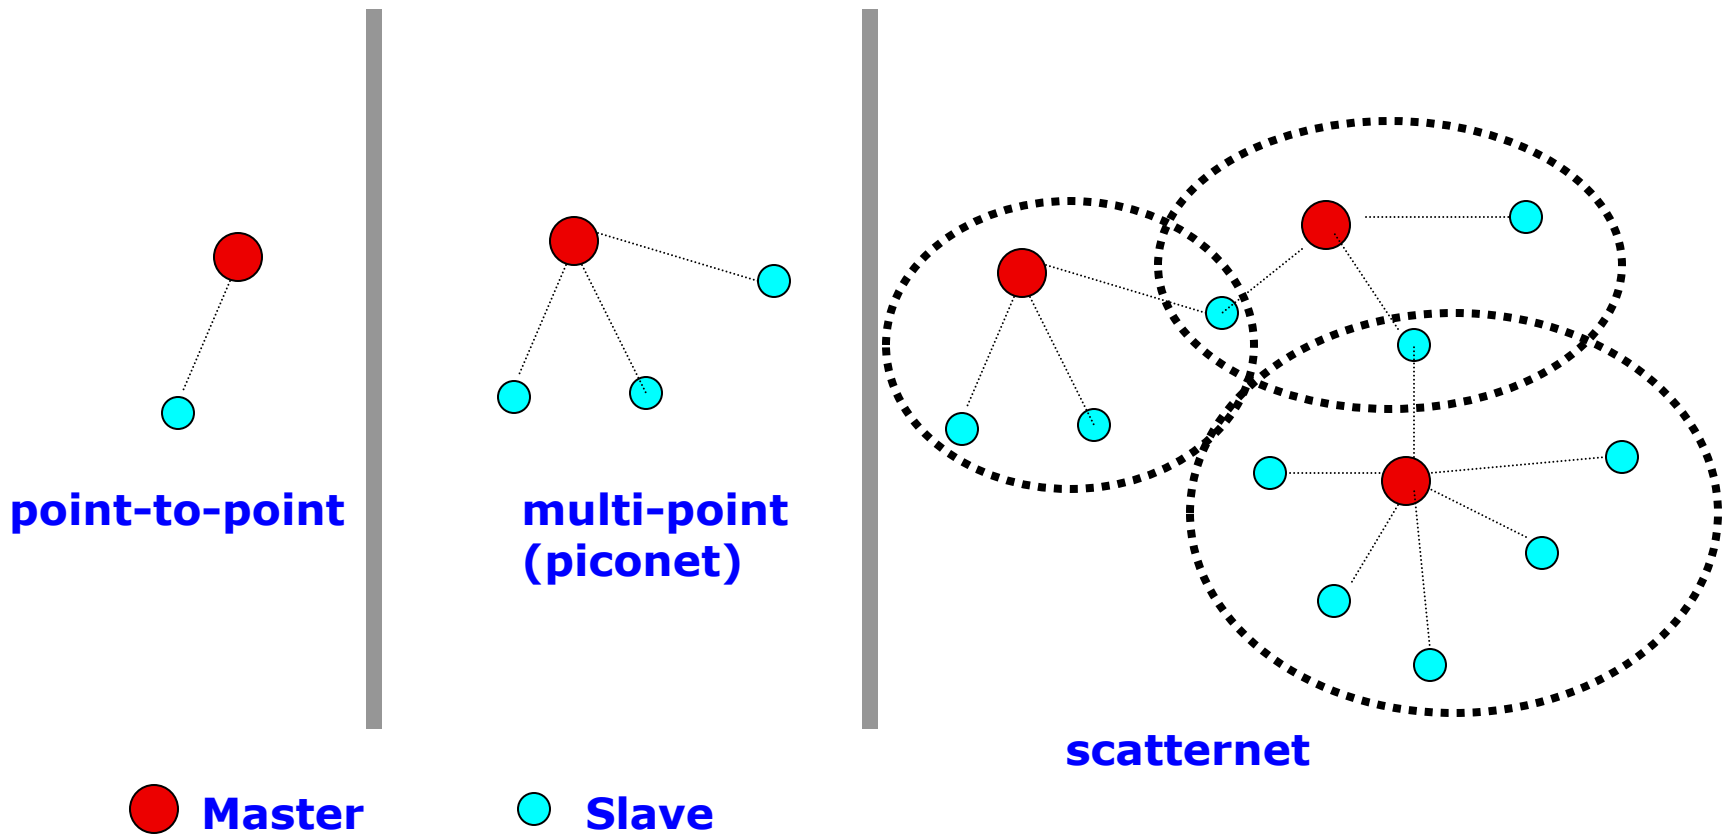

Fig. 1. Examples of slave-slave communication in piconets: (a) supporting slave-slave file transfer; (b) supporting slave-slave voice transmission.

# A Scatternet

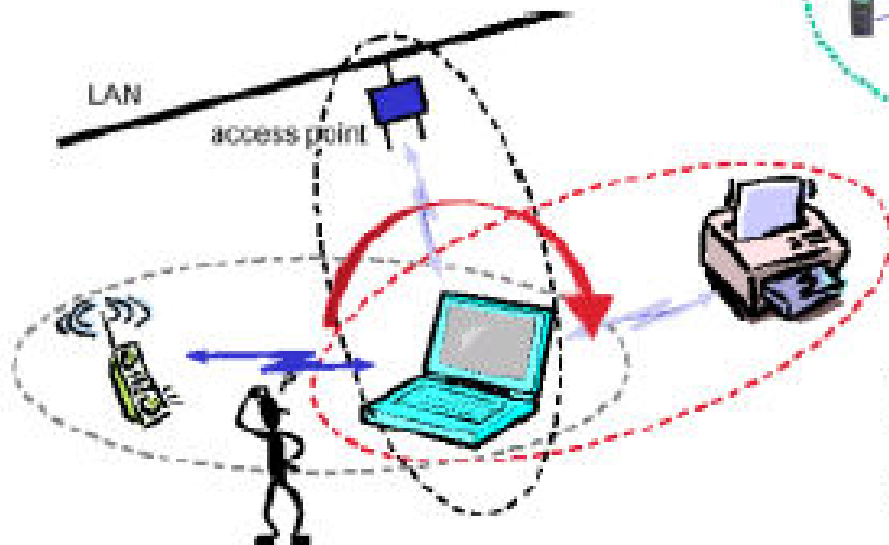

---

# Bluetooth Network

- Piconet

- Scatternet

How to jump efficiently between piconets?

Delay sensitive applications?

Fig. 1. An example of a Bluetooth scatternet with four piconets.

# Technical Specifications

---

- ❑ Uses **2.4Ghz ISM unlicensed band** for communication.
  - ❑ Uses **79 channels** to hop.
  - ❑ Each device hops **1600 times/sec**
  - ❑ Hop Rate = 0.000625 sec = **625µsec**
  - ❑ This duration is called **ONE SLOT**.
  - ❑ Packets are **1, 3 or 5 slots** long
  - ❑ Frame consists of **two** packets
  - ❑ Uses **Spread Spectrum Frequency Hopping (FHSS)** radio
-

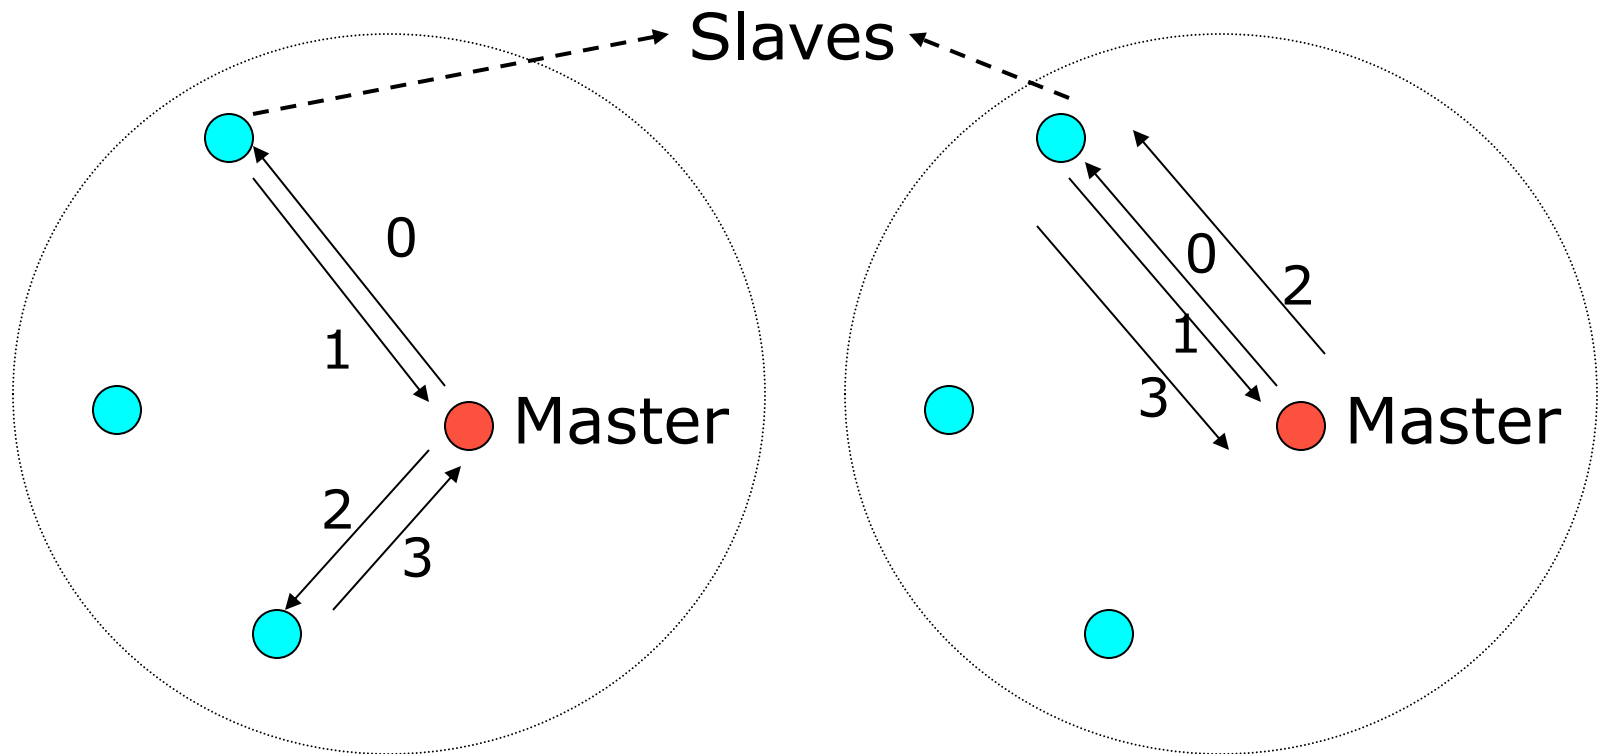

# Technical Specifications

---

- **Data rate: 1Mhz**
    - Symbol rate: 1M bps
    - Data rate: 721Kbps excluding header [Data]
  - Uses Time Division Duplex (**TDD**) technique.
    - Time is divided into 625ms(1 time slot)
    - Master sends packet to its slaves in the **Even** time slot
    - Slave sends packet to its Master in **ODD** time slot
  - Uses 3 Power classes.
  - **Communication Range: 10 m, can be extended to 100 m.**
-

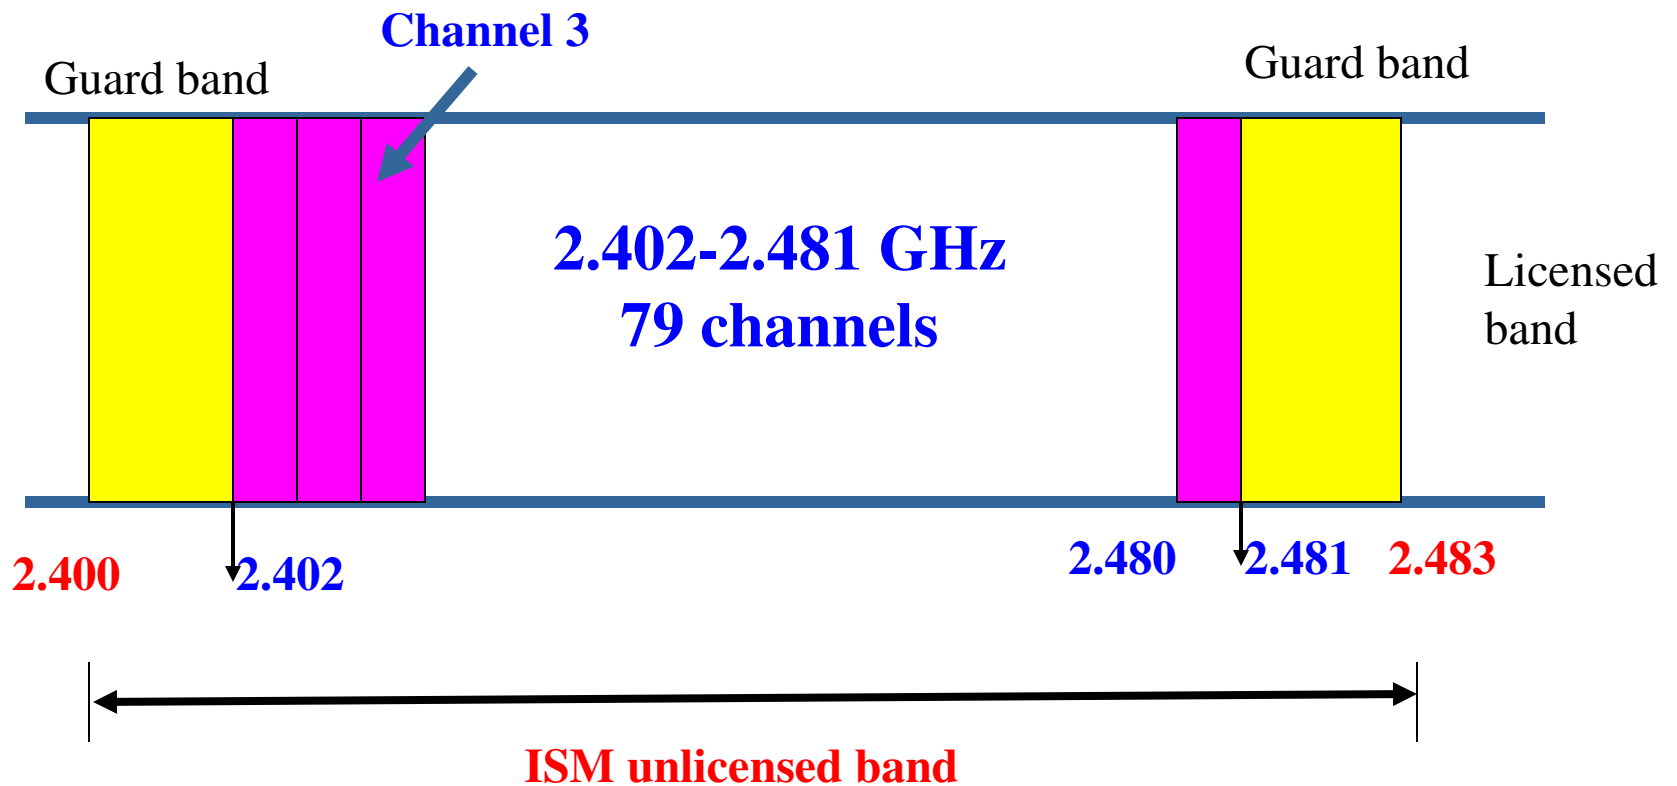

# Master/slave Communication

---

# Bandwidth Management

---

# Bandwidth Management

---

- **2.4GHz ISM band**

- **2402-2483 M Hz**

- **In total, 79 channels are scheduled**

- **Each channel occupies 1M Hz**

- **Bandwidth: 1M bps**

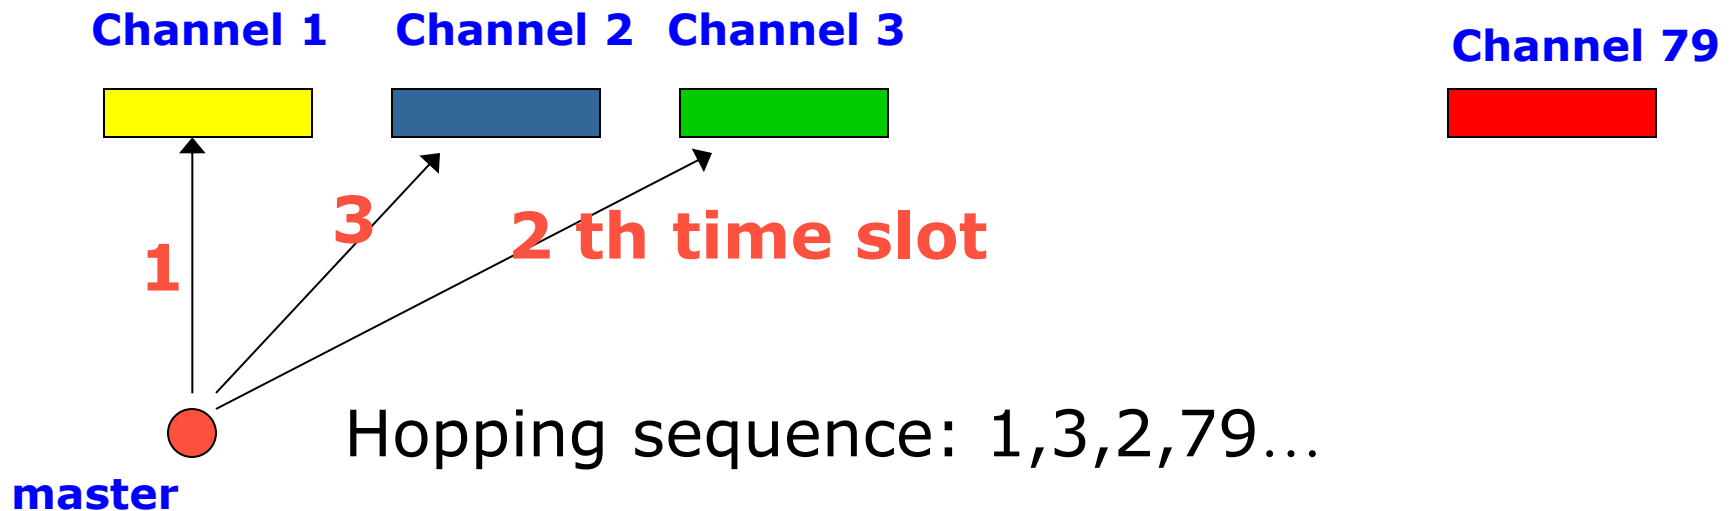

2.4G ISM band

# Frequency hopping

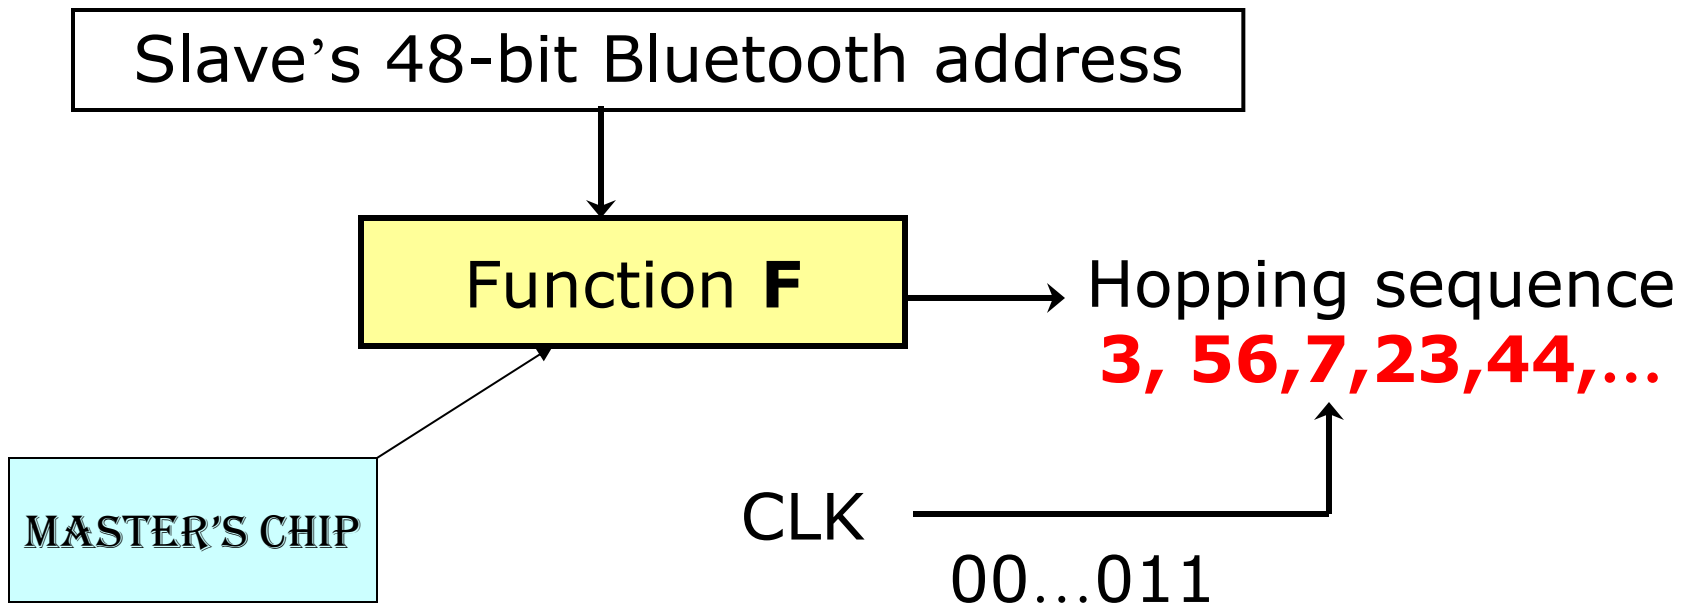

---

- Master hops 1600/s → 0.625ms/hop
- Master hops to another channel according to its hopping sequence

# Hopping Sequence Generation

---

# Master-Slave Connection

---

- How connection is established between the master and slaves?**
  - Two phases:**
    - Before Connection
    - After Connection
  - Before Connection:**
    - Inquiry/Inquiry Scan state
    - Page/Page Scan state
  - After Connection:**
    - Active mode**
    - Hold mode**
    - Sniff mode**
    - Park mode**
-

# Master-Slave Connection

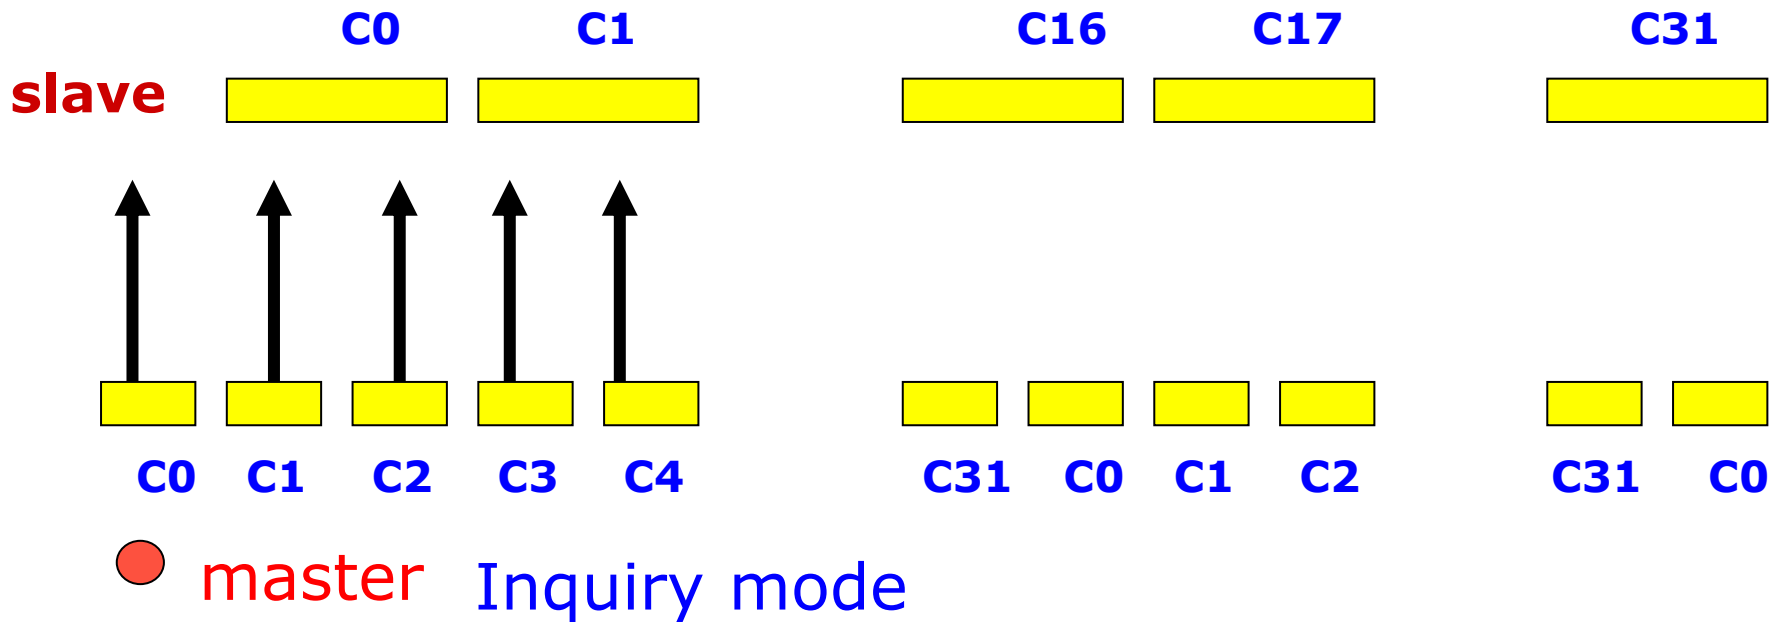

---

- Before connection between Master and Slave:
  - Master uses 32 channels to hop.
    - Master hops in each 312.5  $\mu$ sec.
    - It hops 2 times within a single slot in the same channel.
  - Slave also uses 32 channels to hop.
    - Slave hops in each 625  $\mu$ sec.
    - It hops 1 time within a single slot in the same channel.
-

# Master-Slave Connection

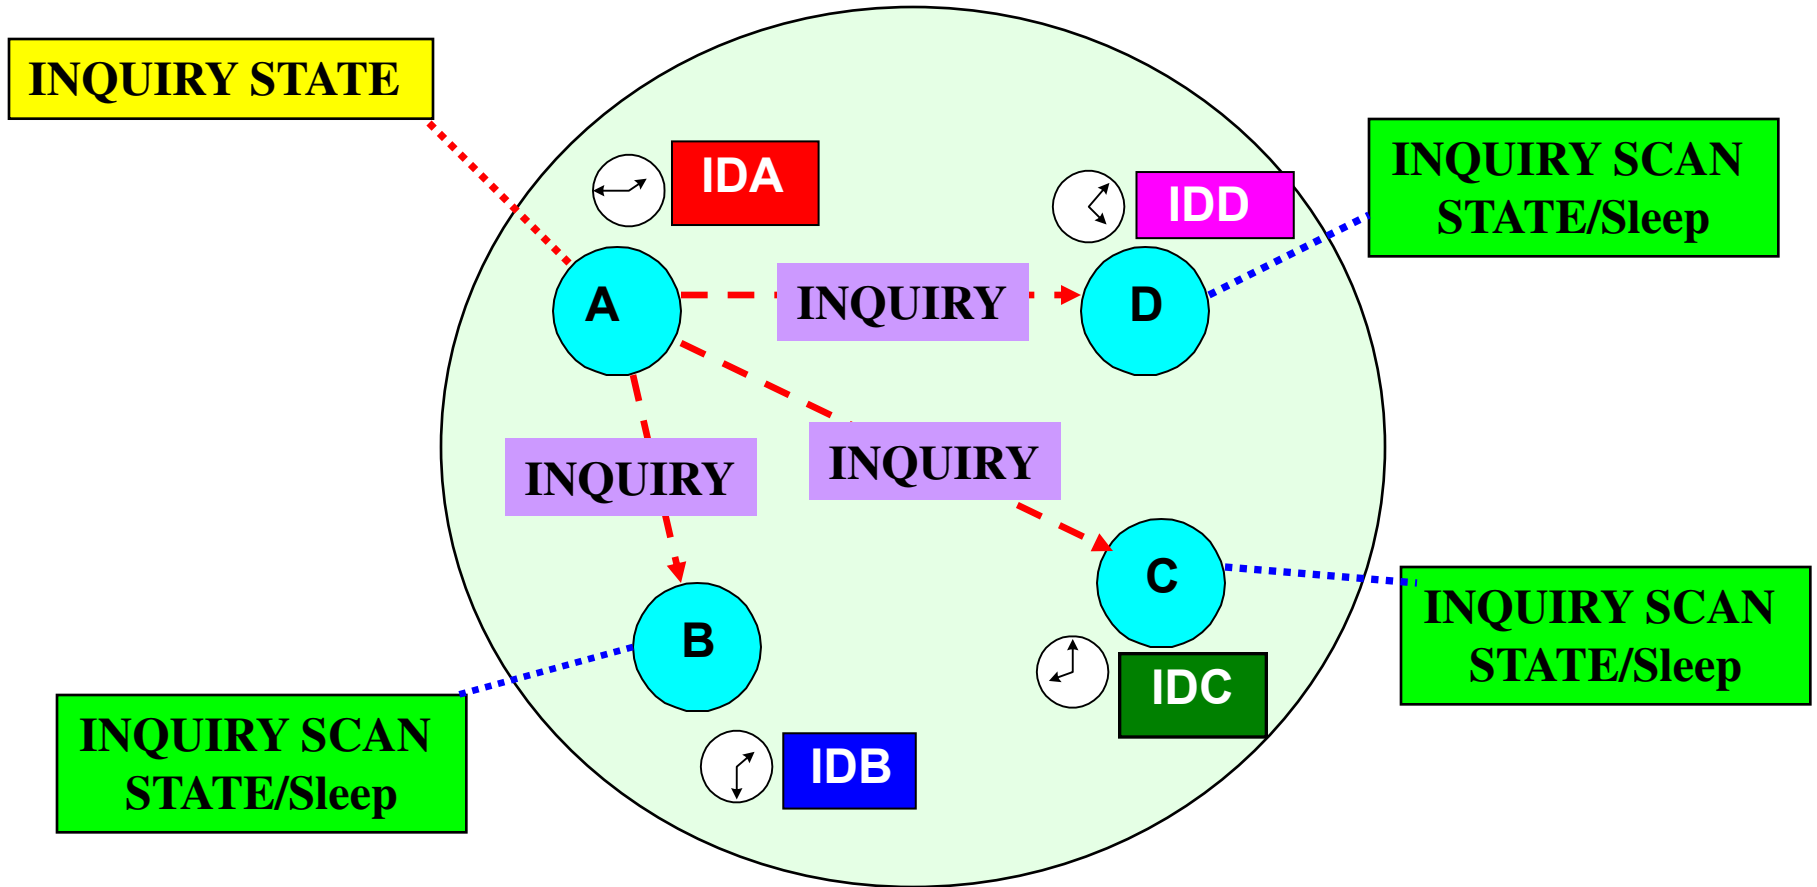

---

Inquiry scan mode

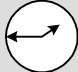

# Master-Slave Connection

# Master-Slave Connection

## DAC Packet:

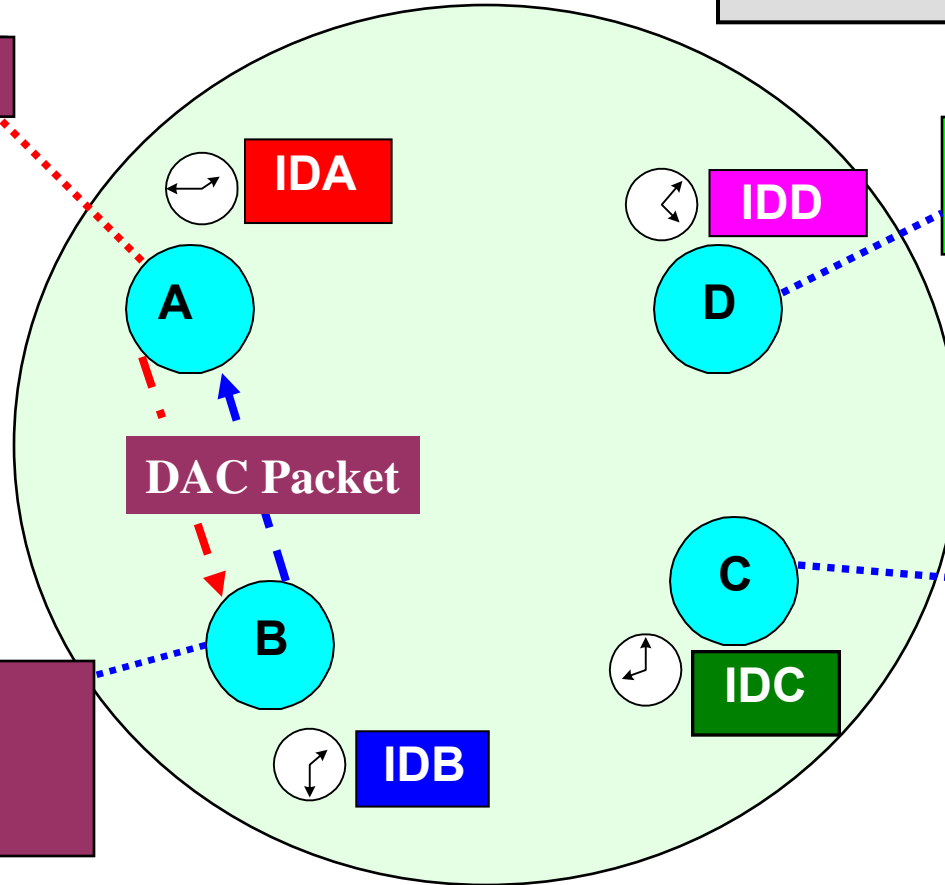

1. A's ID **IDA**
2. A' Clock 
3. Active Member Address

PAGE STATE

## FHS Packet:

1. B's ID **IDB**
2. B' Clock 

PAGE SCAN STATE

INQUIRY SCAN STATE/Sleep

INQUIRY SCAN STATE/Sleep

# Addressing

---

- ❑ ***What is ACTIVE MEMBER ADDRESS:***
  - ❑ It is 3-bit address given by a Master to each slave
  - ❑ AMA address: 000 for broadcasting use
  - ❑ 001-111 for 7 active slaves
  - ❑ ***What is ID here:***
  - ❑ ID is the Bluetooth Device Address
  - ❑ It is always 48-bit
-

# Connection Procedure (2)

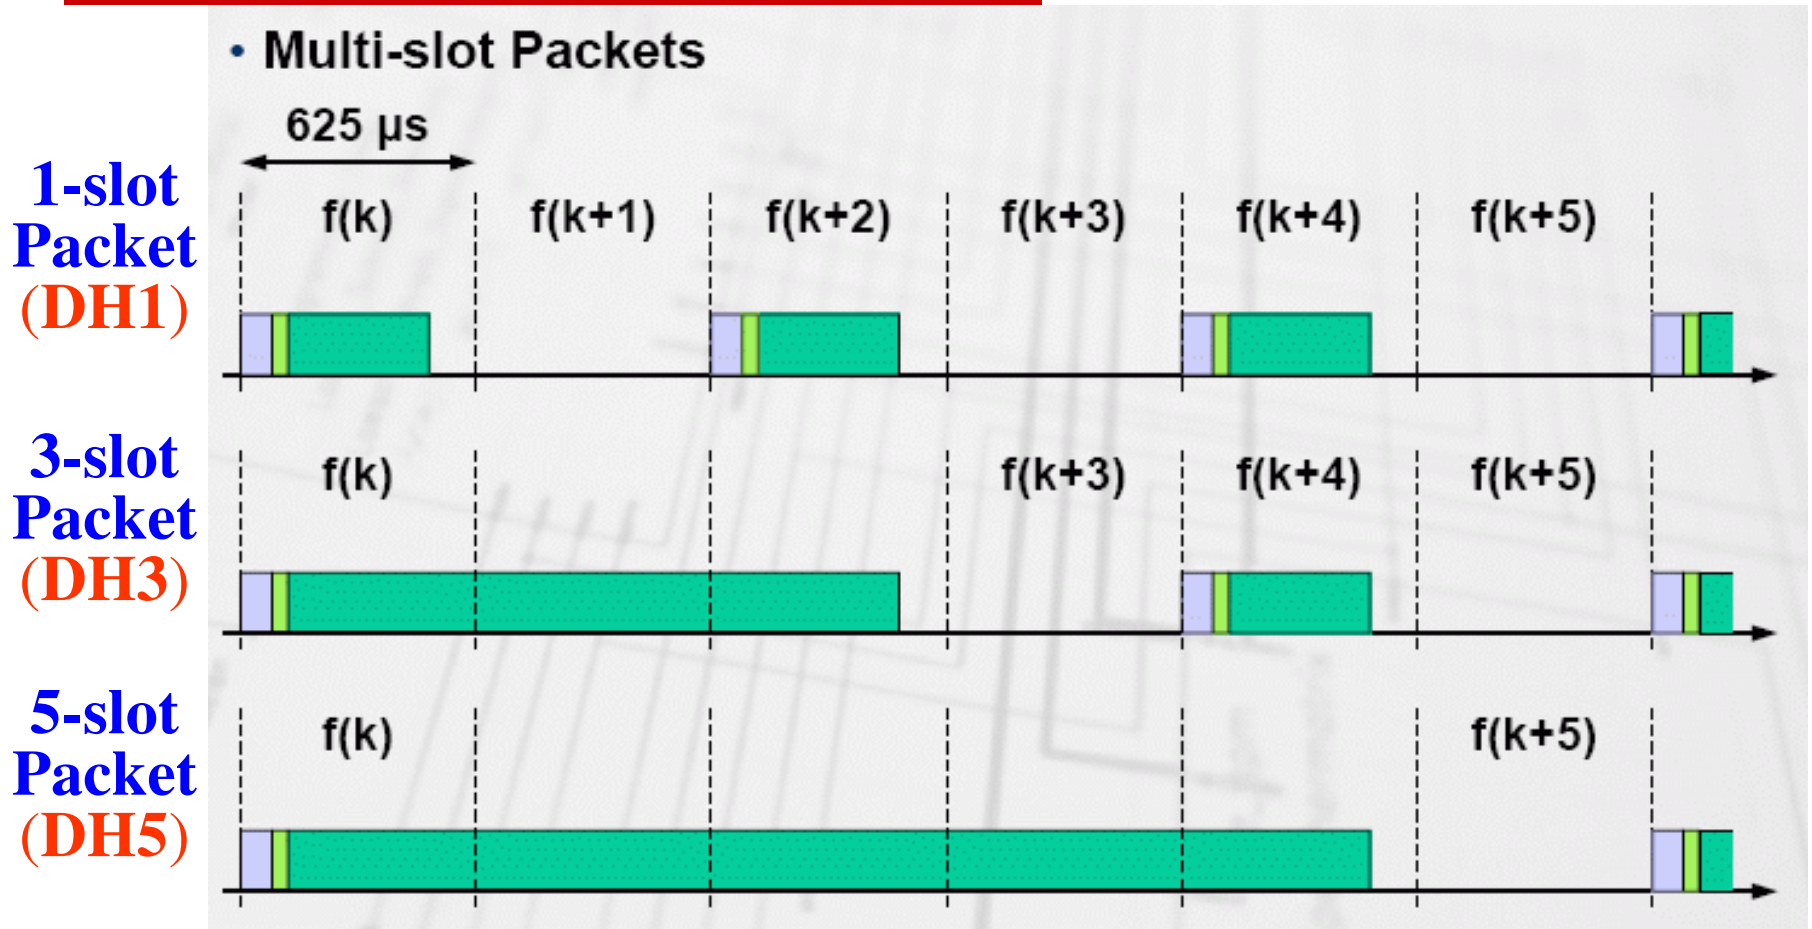

# Post Connection Phase

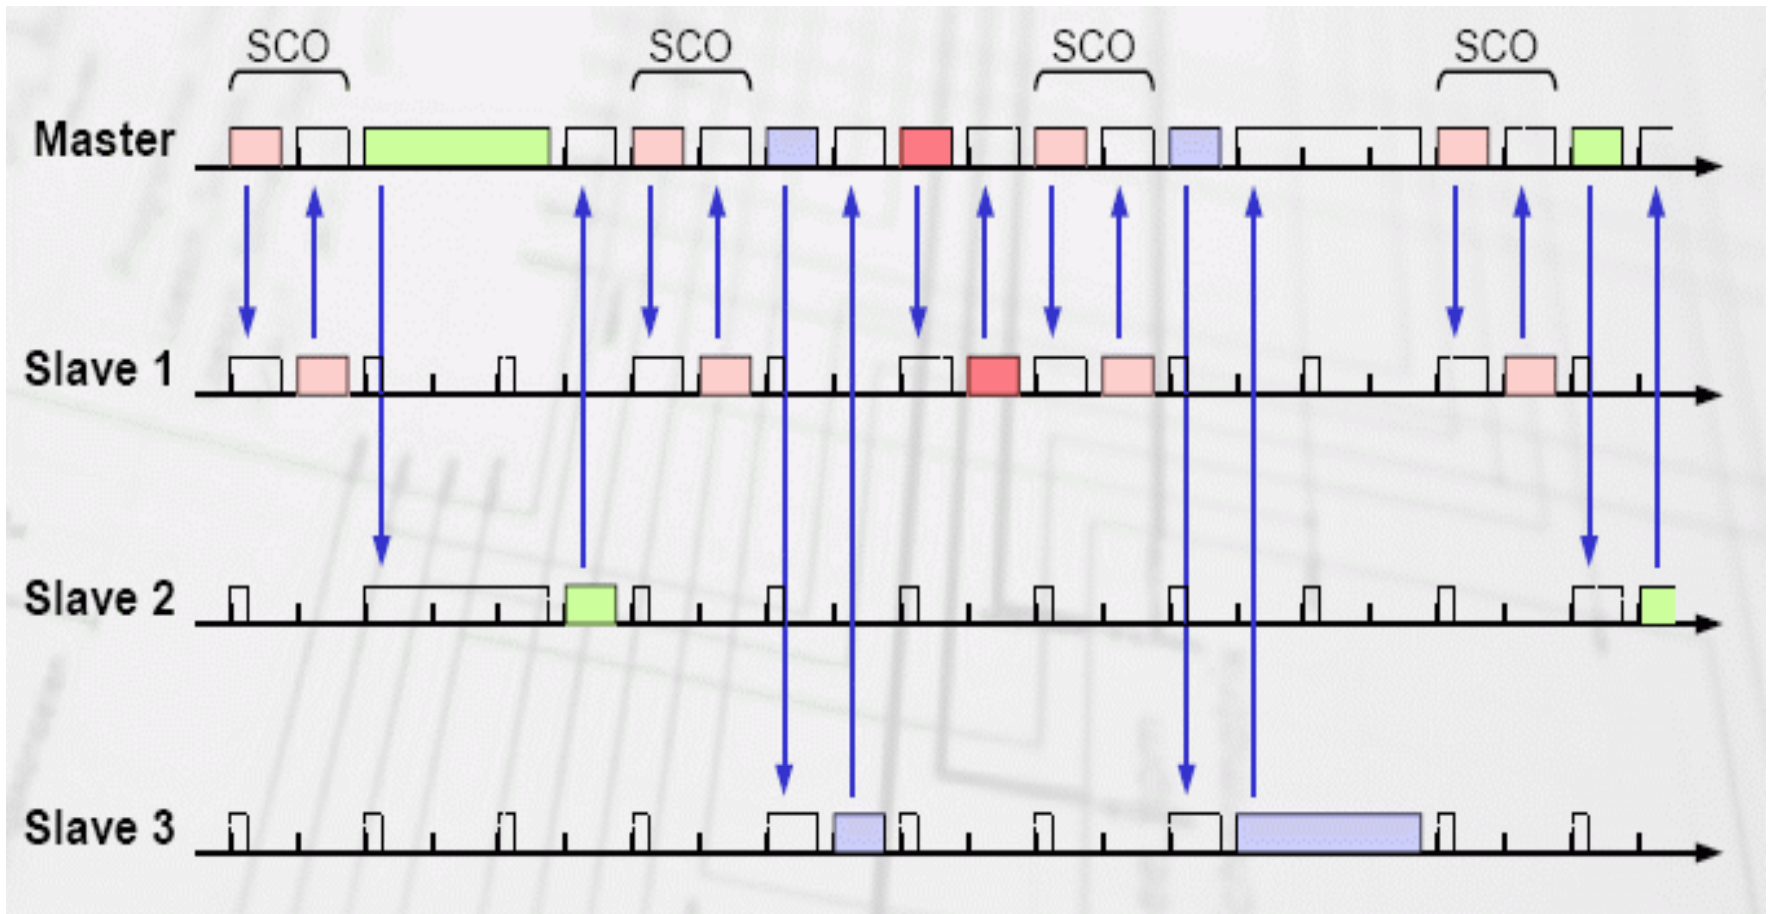

---

- After connection of master and slave:
    - Piconet is constructed
    - All slaves follow the master's hopping sequence
    - Supports both **voice (SCO)** and **data (ACL)** transmission.
    - Three possible power saving modes for each slaves:
      - **Hold mode**
      - **Sniff mode**
      - **Park mode**
-

# Protocol Stack

# Research Issues

---

- Most of the research issues lie in Scatternet.
  - Research Areas:
    - Topology Construction
    - Scheduling
    - Routing
    - Energy consumption
    - QoS
    - Security
-

# Research Issues

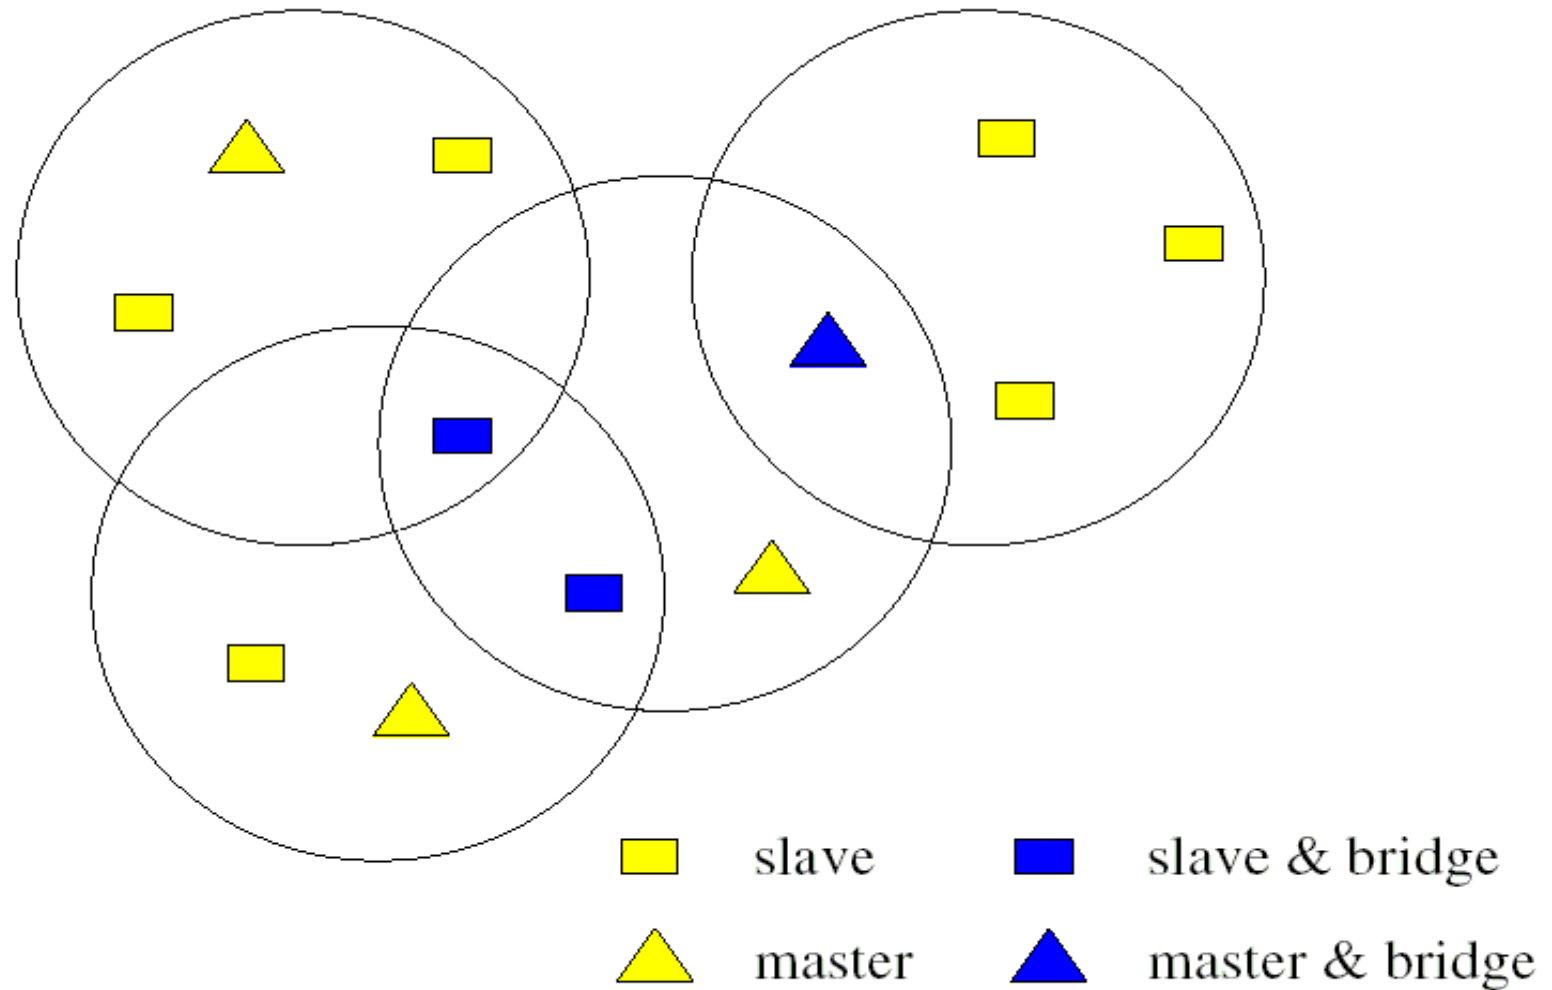

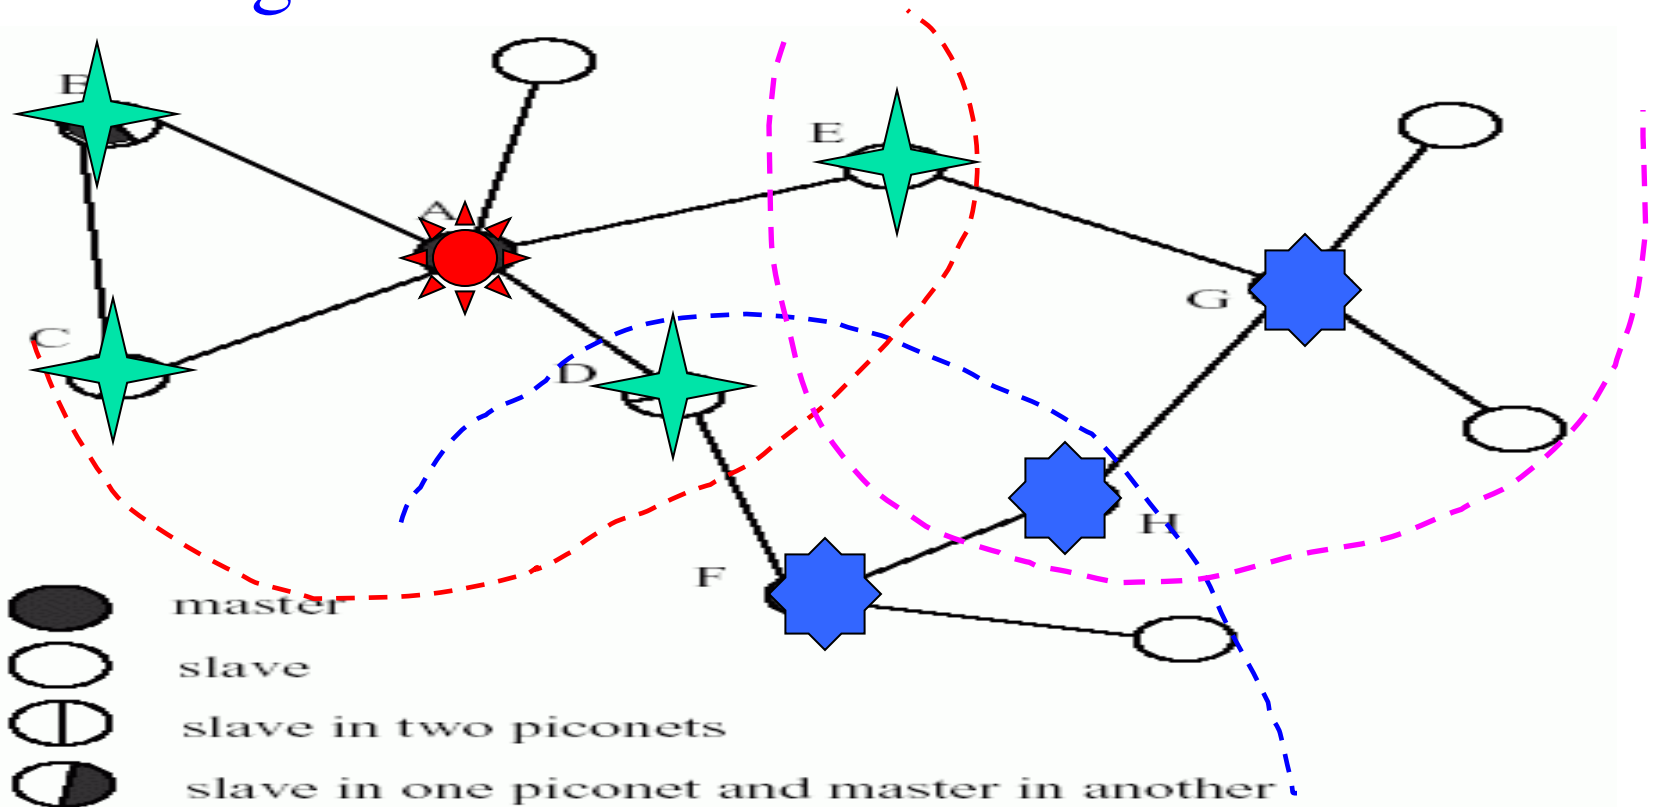

Fig. 1. BT-WPAN topology. **Bluetooth: A Wireless PAN**

# Bluetooth: Scatternet

- A node with multiple BT links may be a Master or Bridge or both.

# An Integrated Scenario

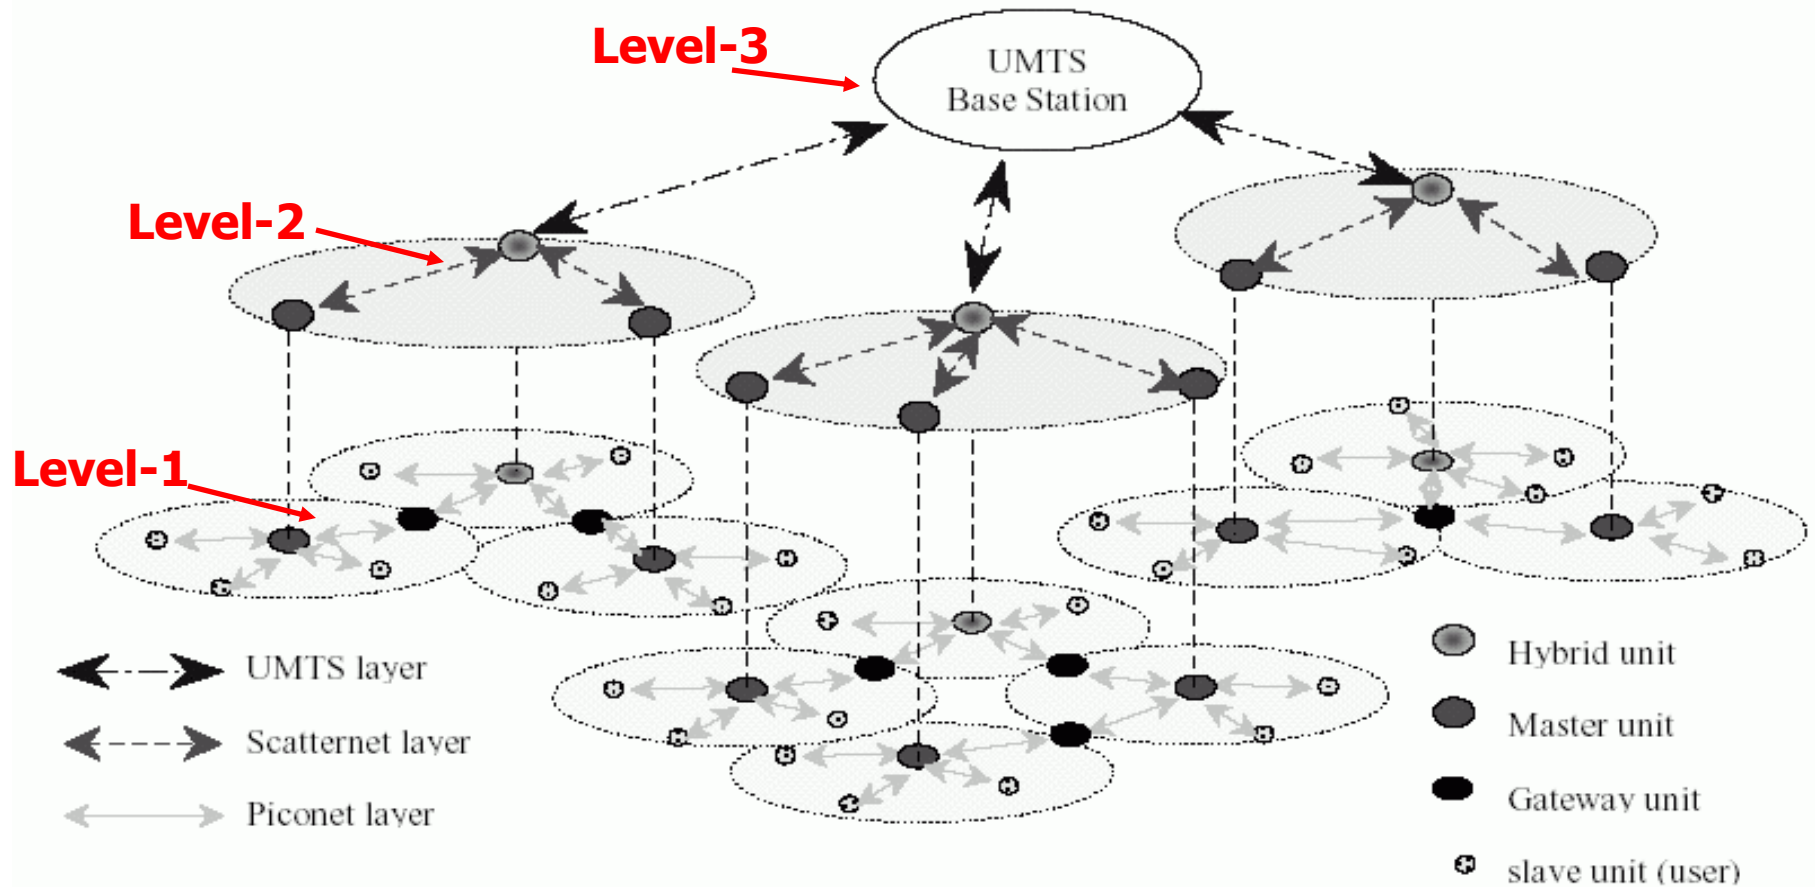

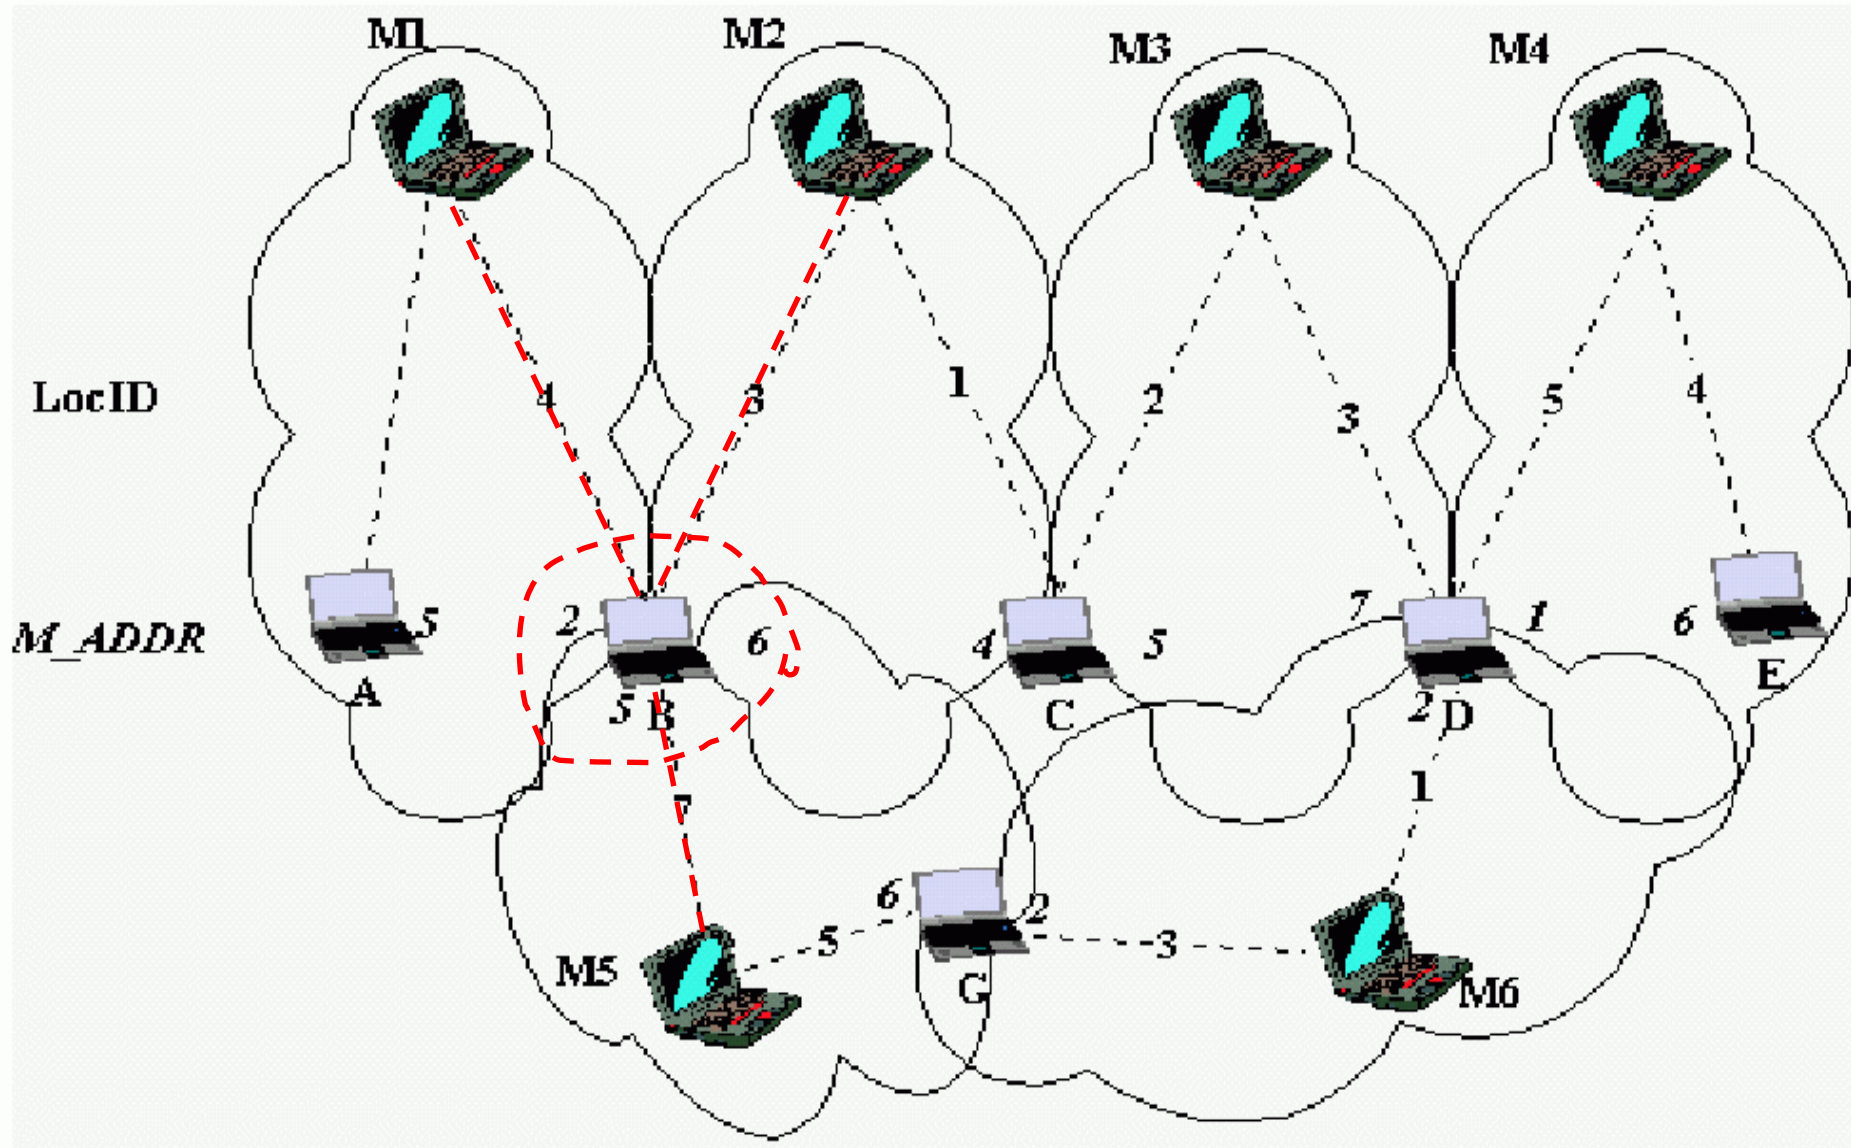

Fig. 1. "Centralized Wireless LAN Architecture" (CWLAN) using Bluetooth and UMTS

# Routing Vector Method (RVM)

# Our Routing Protocol

---

- **Paper Title:**

- **LARP: A Novel Routing Protocol for the Bluetooth Scatternet**

- **Published:**

- **In the Proc. of IEEE, WOCN, Dubai, March, 2005.**

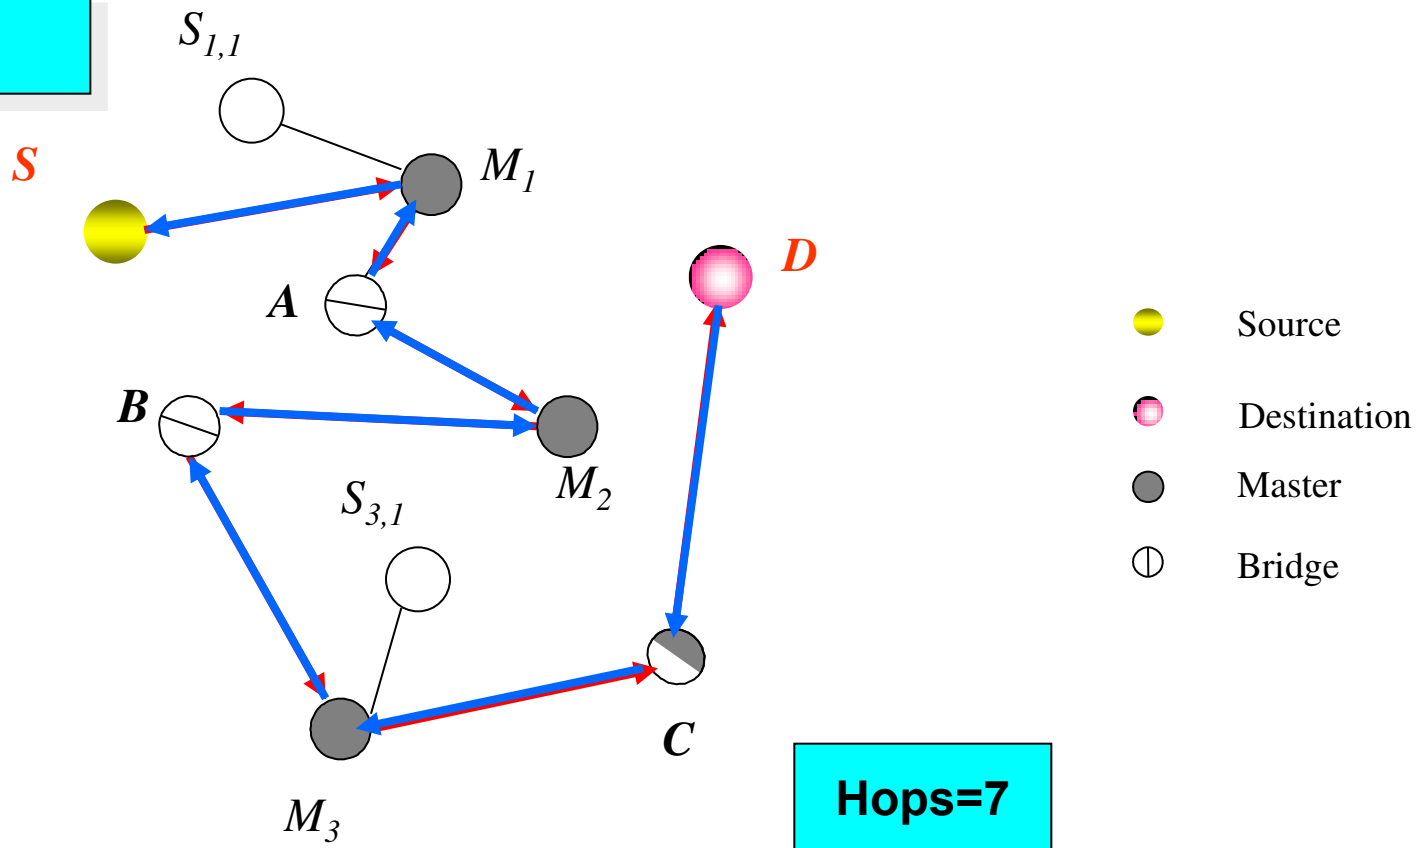

- **Authors:**

- **Chih-Yung Chang, Prasan Kumar Sahoo, Shih-Chieh Lee**

---

# LARP: A Novel Routing Protocol for the Bluetooth Scatternet

# Drawbacks

---

- **Drawbacks of these work:**
    - **Longer routing path length**
    - **Long transmission delay time**
    - **High bandwidth consumption**
    - **High power consumption**
-

# LARP: Location Aware Routing Protocol

## Assumptions:

- Scatternet is **connected**
- Each device has its **location** information
- A source intends to communicate with destination whose **ID is known** and **location is unknown**
- All device have the **neighbor** information
  - *ID, Location and Clock\_offset*
- **Low Mobility**
  - Mall, supermarket

# Environment

---

□ Bluetooth device gets its location information:

- Outdoor —By GPS
- Indoor— RFID

■ **BLN**

□ "Bluetooth Location Networks," Globecom '02

# Reduction

# Route Reply Phase

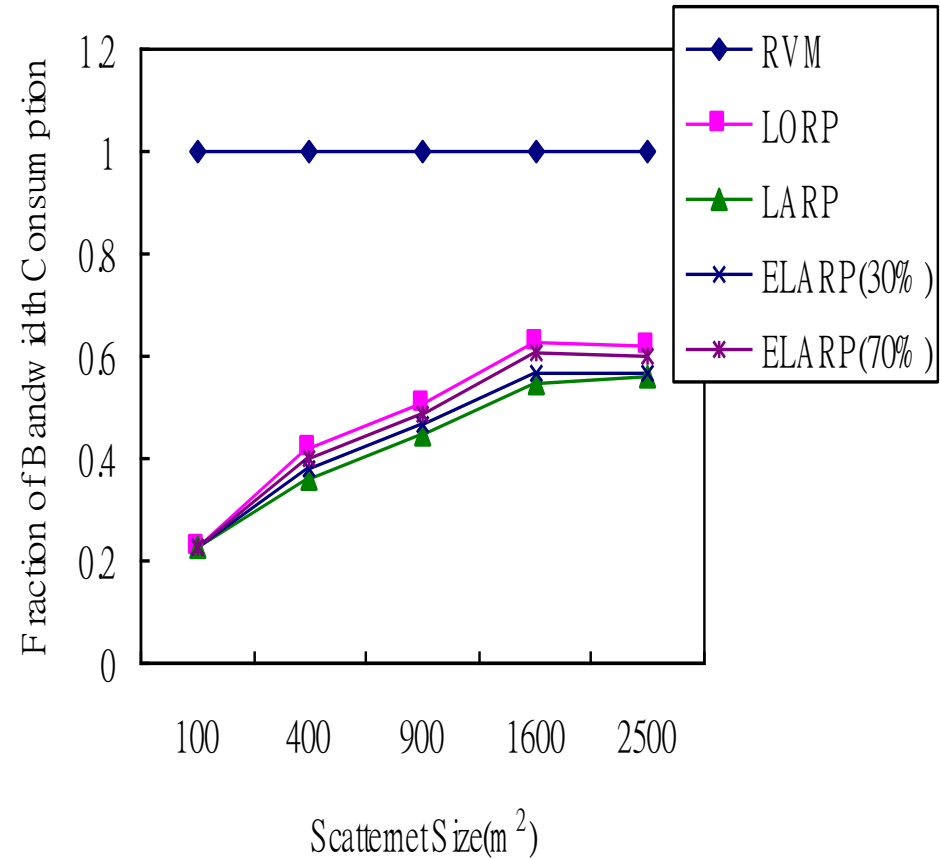

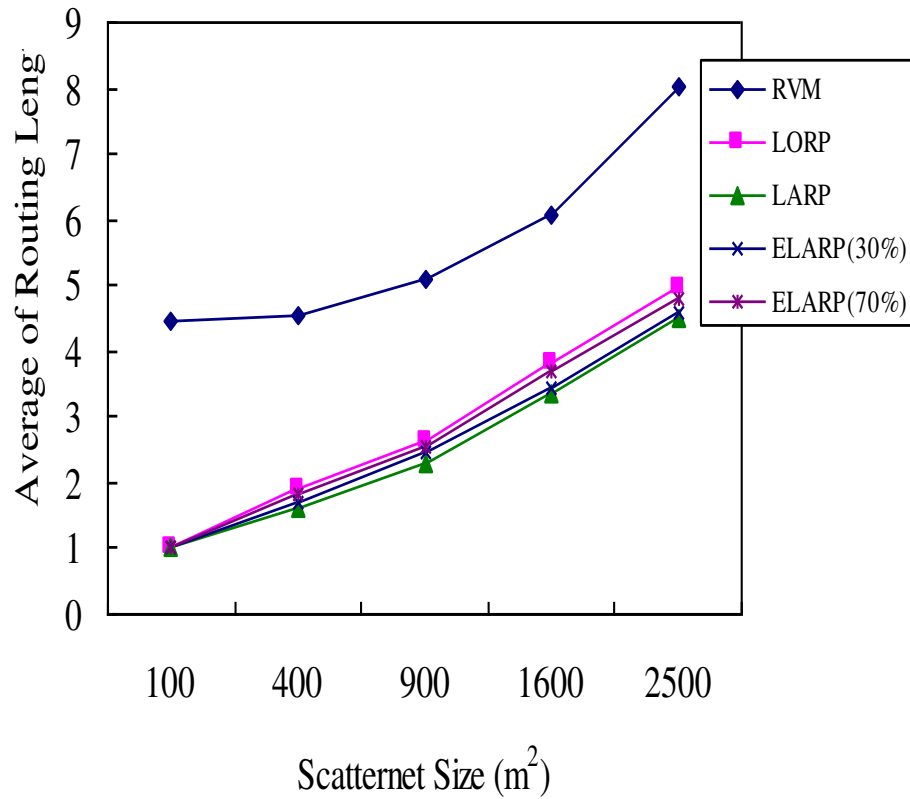

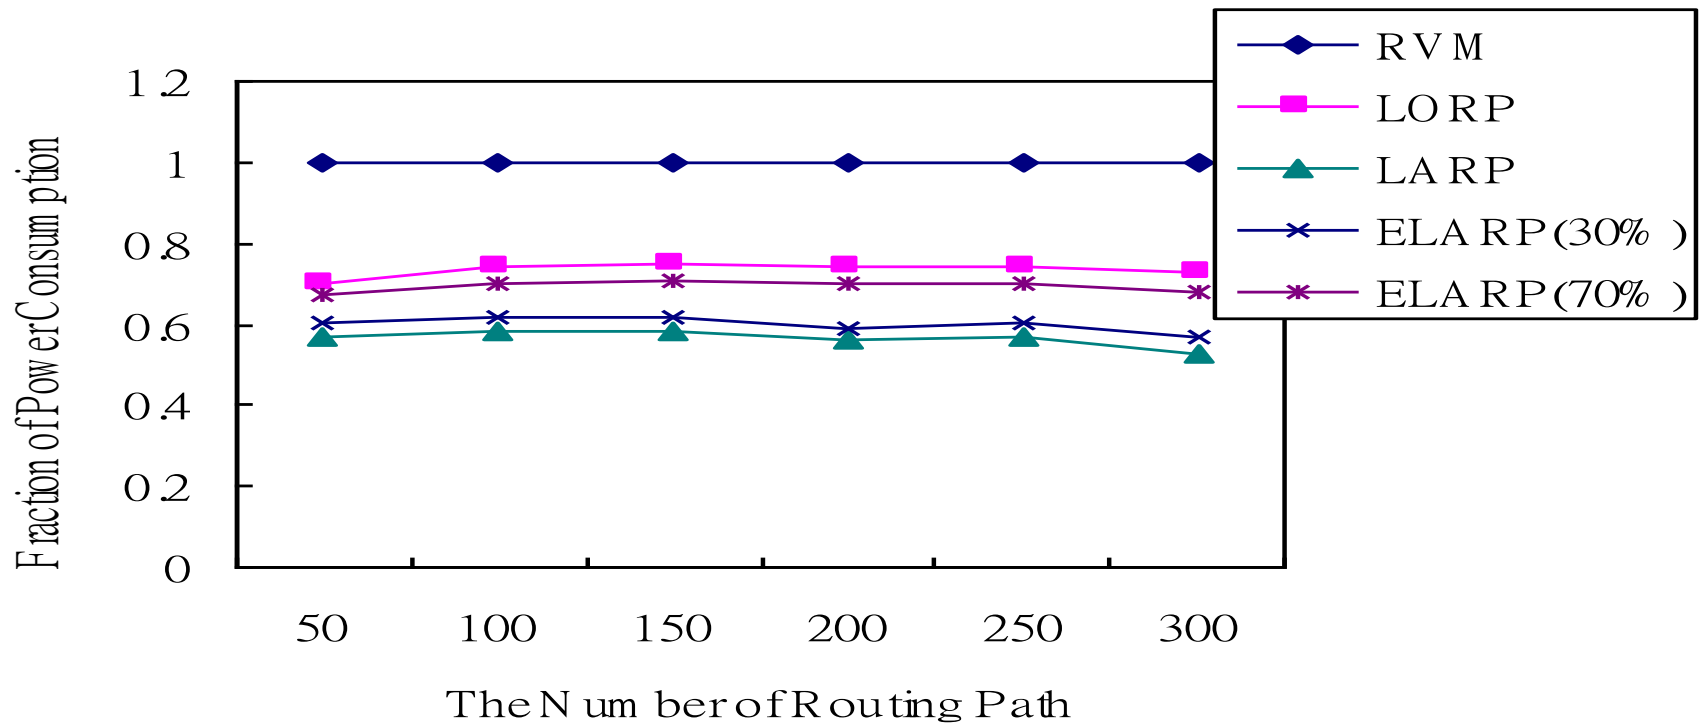

# Route Construction Phase

# Simulation Results

Protocols	Route Length	Transmission delay	Power and Bandwidth consumption	Control Packet
<b>RVM</b>	Long	Long	High	Few
<b>LORP</b>	Short	Short	Low	Many
<b>LARP</b>	Very Short	Very Short	Very Low	Many

# Summary

---

- ❑ Bluetooth Technology is designed to replace wires.
  - ❑ It is one up from IrDA and one down from Wi-Fi WLAN.
  - ❑ IrDa and Bluetooth can coexist.
  - ❑ Bluetooth does not need the device to be in line of sight.
  - ❑ It's communications speed and distance are much worse than available with Wi-Fi.
  - ❑ It supports 'ad-hoc networking'.
-
